2004 Vital Statistics

120th Report Relating to the Registry and Return of Births, Deaths, Marriages, Divorces, Civil Unions and Dissolutions

Department of Health
Agency of Human Services

Vermont Vital Statistics Annual Report

2004

State of Vermont
James H. Douglas, Governor

Agency of Human Services
Cynthia D. LaWare, Secretary

Department of Health
Sharon G. Moffatt, RN, MSN, Acting Commissioner

November 2007

Printed on recycled paper.

We gratefully acknowledge the contributions of the medical records staff, physicians and midwives, funeral directors, lawyers, and court clerks for their help in collecting and providing us with this data.

We also recognize the 251 town and city clerks, who are our local registrars. Without them, these analyses of Vermont's vital statistics would not be possible.

Introduction

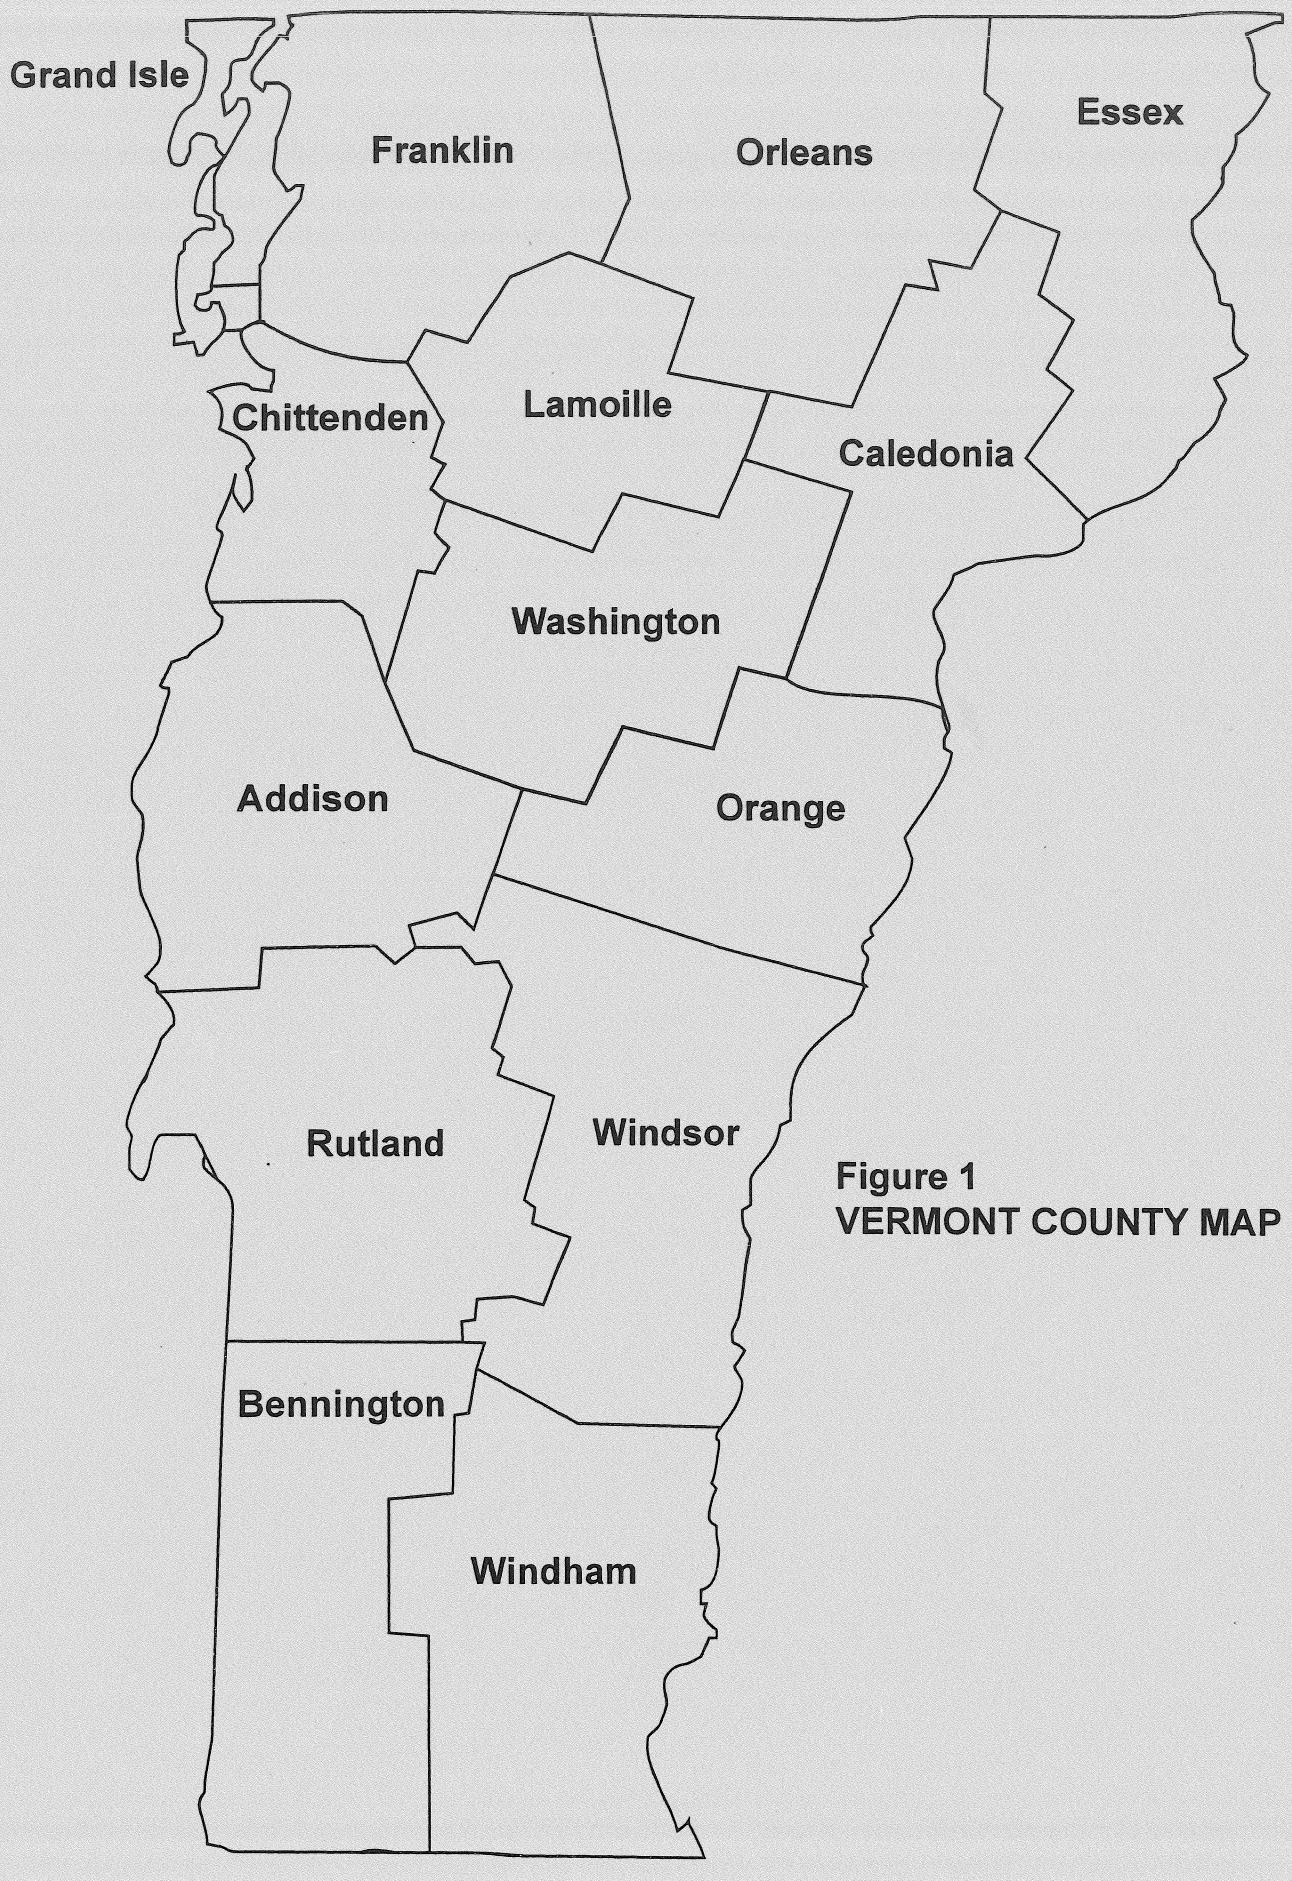

Figure 1
VERMONT COUNTY MAP

THE VERMONT VITAL STATISTICS SYSTEM

Statewide vital registration began in Vermont in 1857, when the General Assembly passed a bill requiring that towns report all births, marriages, and deaths occurring in their jurisdiction to the Secretary of State. The legislature also required periodic publication of tables from the reports. This volume is the latest in a series of publications begun in 1857. Historically, the information contained on vital records has served as an important tool for public health officials and others by providing a picture of the general health of the population. Recognizing its importance, in 1896 the Legislature transferred responsibility for the vital statistics system to the newly formed Board of Health, the forerunner of the Vermont Department of Health. The Health Department has retained this responsibility to the present day.

The Vermont vital statistics system monitors the following vital events: births, deaths, marriages and civil unions, divorces and dissolutions, fetal deaths, and abortions. Each type of vital record follows a different path before being used to produce the statistics published here.

Births: When a birth occurs, the physician, midwife, or other birth attendant is required to complete a birth certificate and file it with the town clerk in the town of birth within 10 days. For hospital births, it is usually the medical records staff that completes the birth certificate. The completed birth certificate is recorded and filed in the town where the birth took place, and a certified copy is sent to the Health Department.

Deaths: Although a physician is responsible for filing the death certificate, the job may be, and often is, delegated to the funeral director. Most of the information needed to complete the death certificate is obtained from the family of the deceased. A physician, however, must complete the cause of death information and sign the death certificate. The funeral director files the completed certificate with the town clerk who sends a certified copy to the Health Department.

Marriages and civil unions: When a couple wishes to marry or establish a civil union in Vermont, they provide a town clerk with the information needed to complete the license. The couple takes the license to an officiant, who signs and dates it, and returns it to the town clerk. The town clerk records and files the certificate, and sends a certified copy to the Health Department.

Divorces and dissolutions: A divorce certificate or certificate dissolving a civil union is initiated by a lawyer or other individual handling the divorce or dissolution. The certificate is filed with the court as part of the divorce or dissolution proceedings. The court keeps the certificate until the decree becomes final, usually three months after the court hearing. When the decree is final, the court clerk signs the certificate and sends it to the Health Department for filing.

Fetal deaths and abortions: Reports of fetal death and induced termination of pregnancy (abortion) are sent directly to the Health Department by the physician, hospital, or clinic that performs the procedure. By law, these reports are for statistical purposes only, are not public records, and are destroyed after five years.

In addition to receiving copies of vital records from Vermont town clerks, the Health Department also receives copies of certificates of all Vermont resident births and deaths that occur in other states and in Canada. This allows the Department to do statistical analyses of vital events involving Vermont residents even if the birth or death occurred outside of the state. Health Department staff code and enter all vital records received into a computerized database. Records with unknown or unlikely data are corrected after querying the data provider. A data file containing statistical information from the records is sent to the National Center for Health Statistics to become part of a national database.

EXPLANATORY NOTES

1. The tables in this bulletin were derived from records of vital events filed at the Vermont Department of Health for calendar year 2004.

2. Rates are based on the 2004 population estimates from Claritas, Inc.

3. Caution must be used in comparing rates due to the small population in Vermont and the small number of events recorded.

4. Rate comparisons throughout are made to the U.S. white (Hispanic and non-Hispanic) population rather than entire U.S. population. This is because only 3.2 percent of the Vermont population was non-white as of the 2000 U.S. Census.

5. If you have questions about the information found in this bulletin, you may contact a statistician at the Vermont Department of Health, 802-863-7300.

6. If you have questions about the population figures found in this bulletin, you may call the Vermont Department of Health to request a copy of *The Population and Housing Estimates*, which also provides information about age groups other than those presented in this publication.

7. The following is a list of Vermont's counties and the county abbreviations that are used in this bulletin.

Addison	ADD	Lamoille	LAM
Bennington	BEN	Orange	ORG
Caledonia	CAL	Orleans	ORL
Chittenden	CHI	Rutland	RUT
Essex	ESS	Washington	WAS
Franklin	FRA	Windham	WDM
Grand Isle	GI	Windsor	WDR

DEFINITIONS, RATES, AND RATIOS

ABORTION: The purposeful interruption of an intrauterine pregnancy with the intention other than to produce a live-born infant or other than to remove a dead fetus, and which does not result in a live birth.

ABORTION RATE: Number of resident abortions occurring in Vermont x 1000, divided by the total resident women ages 15 to 44.

ABORTION RATIO: Number of resident abortions occurring in Vermont x 1000, divided by the total resident live births.

AGE ADJUSTMENT: Age adjusting allows one to compare rates among populations having different age distributions by adjusting the crude rates in each population to a standard population base. In this bulletin, county rates are adjusted using the state population distribution as the standard.

The computation formula is: The sum of (age-specific rate for each age group x standard population in that age group) multiplied by 1000, and then divided by the total standard population.

AGE-SPECIFIC DEATH RATE: Number of resident deaths in a specific age group x 1000, divided by the total resident population in a specific age group (using population estimates as of July 1).

AGE-SPECIFIC FERTILITY RATE: Number of resident live births to mothers in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

AGE-SPECIFIC PREGNANCY RATE: Number of resident pregnancies to women in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

ANNULMENT: The invalidation or voiding of a marriage, or civil union, which confers on the parties the status of never having been married to each other.

CIVIL UNION: A civil union is a legal relationship that provides for same-sex couples in Vermont all the benefits, protections, and responsibilities under law as are granted to spouses in a marriage.

CIVIL UNION RATE: Total number of civil unions x 1000, divided by the total resident population (using population estimates as of July 1).

CRUDE BIRTH RATE: Number of resident live births x 1000, divided by the total resident population (using population estimates as of July 1).

CRUDE DEATH RATE: Number of resident deaths x 1000, divided by the total resident population (using population estimates as of July 1).

CUMULATIVE ROW PERCENT: The total number of cases in the current column plus each previous column in each row, expressed as a percentage of all cases in that row.

DEATH: The permanent disappearance of any evidence of life at any time after live birth.

DIVORCE: The final legal dissolution of a marriage.

DIVORCE RATE: The sum of the number of divorces and annulments x 1000; divided by the total resident population, (using population estimates as of July 1).

DISSOLUTION: The final legal dissolution of a civil union.

FERTILITY RATE: Number of resident live births to women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44 (using population estimates as of July 1).

FETAL DEATH: A reportable fetal death is a death prior to the complete expulsion or extraction from the mother of a product of conception, which has passed through at least the 20th week of gestation or weighs more than 400 grams; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

FETAL DEATH RATE: Number of resident fetal deaths x 1000, divided by the total resident live births and resident fetal deaths.

FETAL DEATH RATIO: Number of resident fetal deaths divided by total resident live births.

INFANT DEATH: Death occurring in the first year of life.

INFANT DEATH RATE: Number of resident infant deaths x 1000, divided by the total resident live births.

LIVE BIRTH: The complete expulsion or extraction from the mother of a product of conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

LOW BIRTH WEIGHT: A baby weighing less than 2,500 grams (5 pounds, 8 ounces) at birth.

LOW BIRTH WEIGHT PERCENT: The number of live births weighing less than 2,500 grams divided by the total number of live births.

MARRIAGE: The legal union of persons of opposite sex.

MARRIAGE RATE: Number of marriages x 1000, divided by the total resident population (using population estimates as of July 1).

NATURAL INCREASE: Occurs when the number of births is greater than the number of deaths.

NEONATAL DEATH: Death of a live-born infant before the infant becomes 28 days old (up to and including 27 days, 23 hours, 59 minutes from the moment of birth).

NEONATAL DEATH RATE: Number of resident neonatal deaths x 1000, divided by the total resident live births.

OCCURRENCE: The place where the event actually occurred.

PERINATAL DEATH: A fetal death or a death occurring before the infant becomes seven days old (up to and including six days, 23 hours, 59 minutes from the moment of birth).

PERINATAL DEATH RATE: Number of resident perinatal deaths x 1000, divided by the total resident live births and resident fetal deaths.

PLURALITY: The number of siblings born as a result of this pregnancy.

PREGNANCY RATE: Number of resident pregnancies in women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44.

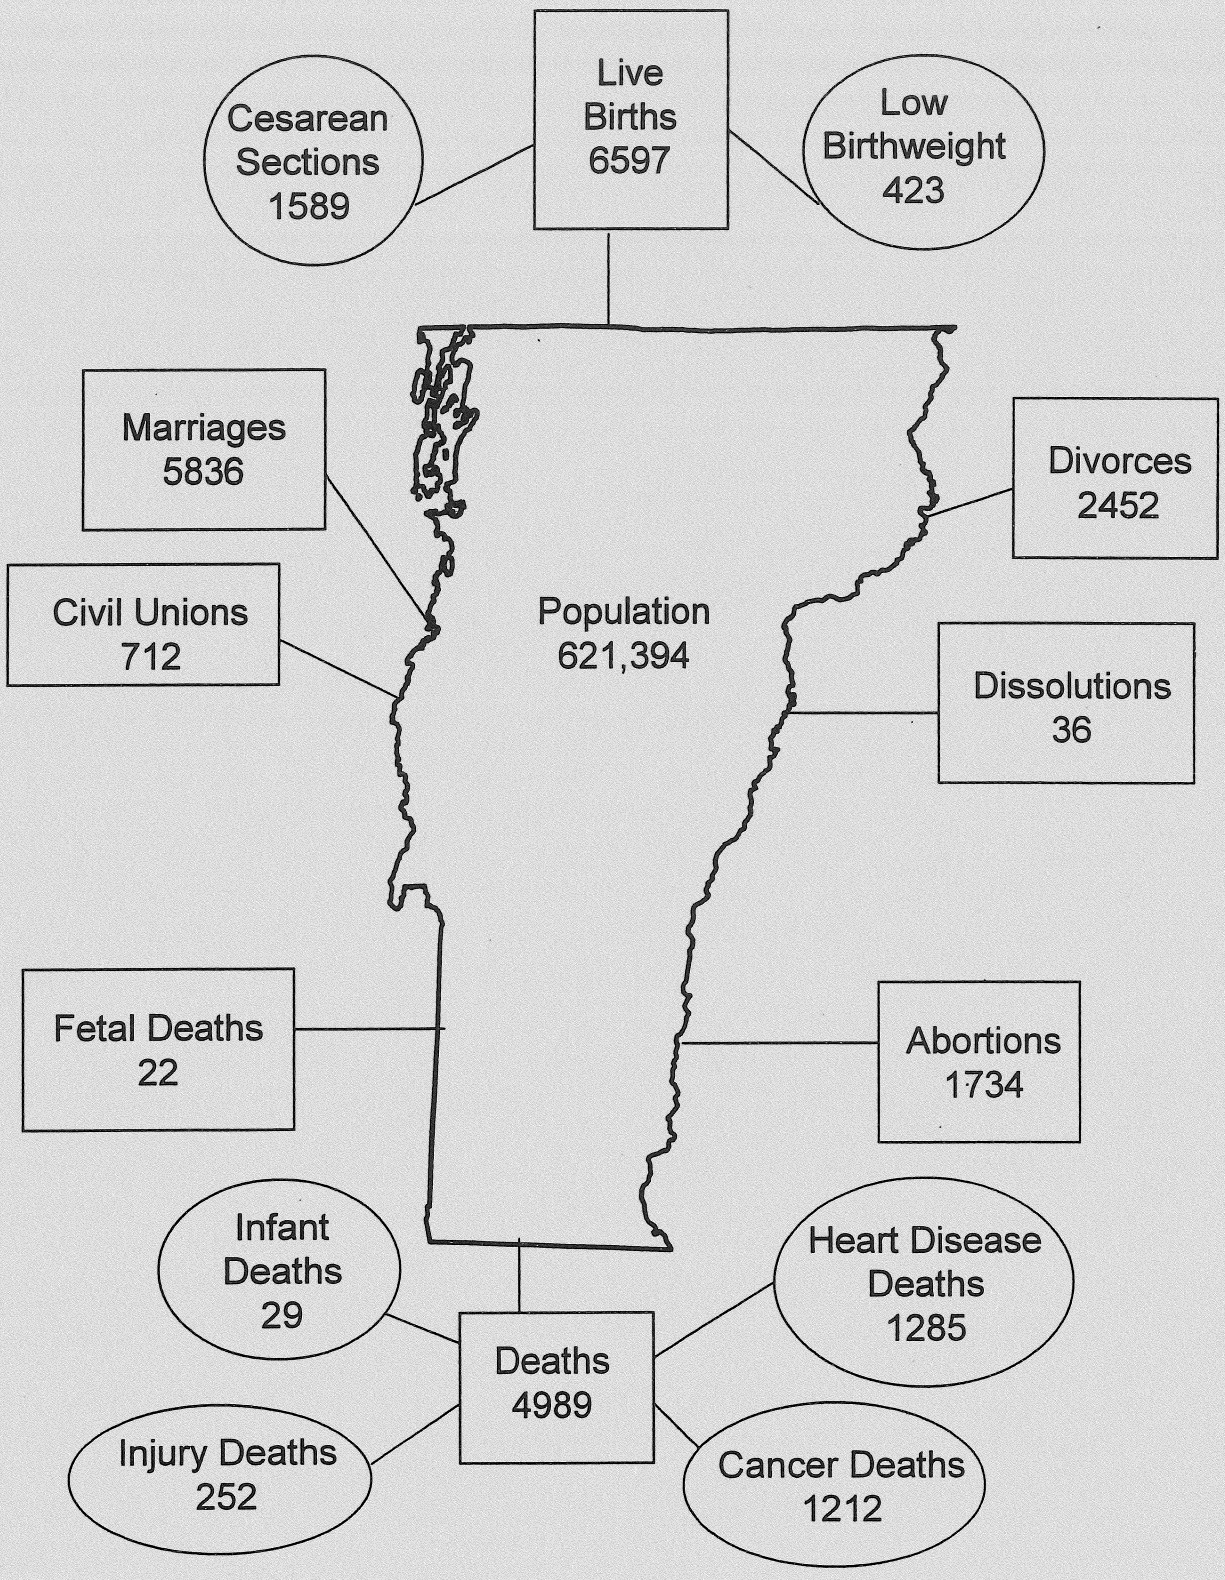
RESIDENCE: The usual place of residence for the person to whom the event occurred. For births and fetal deaths, residence is defined as the mother's usual place of residence.

ROW PERCENT: The number of cases in each row expressed as a percentage of all cases in that row.

WEEKS OF GESTATION: The number of weeks elapsed between the first day of the last menstrual period and the date of delivery.

Summary and Population

Figure 2.
Vermont Vital Events for 2004



Marriages, divorces, civil unions, dissolutions and abortions displayed above are occurrence data.
All other events are resident data.

SUMMARY STATISTICS

Occurrence statistics include all events recorded in Vermont, including those involving visitors living outside Vermont. **Resident** statistics are limited to the events involving people with legal residence in Vermont, including events occurring outside Vermont. In 2004, reports of births and deaths to Vermonters were received from 25 states and Canada.

SUMMARY OF 2004 VITAL EVENTS

	Occurrence Number	Resident Number	Resident Rate
Births	6,262	6,597	10.6/1,000 population
Deaths	4,998	4,989	8.0/1,000 population
Natural Increase	N/A	1,608	2.6/1,000 population
Infant Deaths	30	29	4.4/1,000 live births
Fetal Deaths	28	22 (1)	3.3/1,000 live births and fetal deaths
Abortions	1,734	1,500 (1)	11.8/1,000 women ages 15 to 44
Marriages	5,836	N/A	9.4/1,000 population (2)
Divorces	2,452	N/A	3.9/1,000 population (2)
Civil Unions	712	N/A	1.1/1,000 population (2)
Dissolutions	36	N/A	(3)

2004 population: 621,394

---

(1) Does not include out-of-state occurrences
(2) Based on number of occurrences
(3) Rate less than 1

POPULATION

Vermont's population in 2004 was estimated at 621,394. This was a 2.1 percent increase from the 2000 Census count of 608,827, and an increase of 2,278 people from the 2003 estimate of 619,116.

The age-sex distribution of Vermont is illustrated in Figure 3. The largest segment of the population is the 40 to 49 year old age group, and the fastest growing segment of the population is the 45-64 year old age group. The sex distribution of Vermonters shows males outnumbered females up to age 29, and females slightly outnumbered males from age 30 to 69. After age 70, females outnumbered males by an increasing margin.

The 2004 population estimates were produced for the Vermont Department of Health by Claritas, Inc.

Figure 3. Population Age-Sex distribution of Vermont, 2004.

1. Resident data unless otherwise noted.
2. Population is the census population for those years when the census was taken and is the mid-year estimate for non-census years
   NOTE: that mid-year population estimates are revised after each census is taken, so the 1991-1999 population figures and rates in this table differ from those presented in older publications.
3. Rate per 1000 population.
4. Rate per 1000 women ages 15-44.
5. Number of pregnancies includes Live Births and Fetal Deaths for 1857-1972, and Live Births, Fetal Deaths, and Abortions for 1973 – present.
6. Rate per 1000 Live Births.
7. Events per 1000 Live Births.
8. Data for these years is based on occurrence returns only.
9. 1857 population is the 1860 census population.
10. 1857 was the first year that town clerks were required to report vital events to the Secretary of State and returns for that year are incomplete.
11. Corrected from 58.5 to reflect abortions reported late for 2001.
12. Corrected from 203.7 to reflect abortions reported late for 2001.
13. Incorrectly reported as 60.5 in 2002 Vital Statistics Report.
14. Incorrectly reported as 5.9 in 2002 Vital Statistics Report.

BIRTHS

In 2004, 6,597 babies were born to Vermont residents. This represents an increase of eight births from 2003. Until 2002, the number of babies born to Vermont residents had declined every year since 1989. The crude birth rate in 2004 is 10.6 per 1,000 Vermont residents, the same as in 2003 and up from 10.4 in 2002. The U.S. white birth rate for 2004 was 13.5. Comparisons are made to the U.S. white rate because 97 percent of Vermont resident births were to white mothers in 2004 (Table B-5). The Vermont birth rate peaked in 1955 at 24 per 1,000 residents, it then dropped for two decades, remained relatively stable from the late 1970's through the 1980's, and slowly and steadily decreased through the 1990's before stabilizing in recent years.

FERTILITY

Although the crude birth rate is based on the total population, a better measure of birth patterns is the fertility rate which is based on the population of women ages 15 through 44, the peak child-bearing years. The 2004 Vermont fertility rate was 51.9 per 1,000 women ages 15 through 44 (Table B-8), a slight increase from the 2003 rate of 51.0 The U.S. white fertility rate was 66.1 in 2004. The fertility rate in Vermont peaked in 1960 at 126, declined through the 1960's and 1970's, leveled off slightly in the 1980's, steadily declined through the early 90's, and has remained fairly stable since 1995. Age-specific fertility rates have generally declined among the younger age groups (<30), and increased among the older age groups, with the largest increase among 30-34 year olds.

FIGURE 5
AGE-SPECIFIC FERTILITY RATES, SELECTED YEARS 1980-2004

AGES/ YEAR	1980	1990	2000	2004
TOTAL	**63.3**	**60.5**	**49.7**	**51.9**
15 – 19	38.5	34.1	23.4	20.9
20 – 24	102.4	93.9	74.1	71.6
25 – 29	113.0	114.6	102.1	106.4
30 – 34	60.2	79.5	84.0	95.8
35 – 44	12.5	19.6	21.3	22.6

Slightly more than half of all births (50.3 %) in 2004 were to women in their twenties (Table B-7), down from 56.1 percent in 1990. Women age 30 and over accounted for 42.6 percent of births, down from 45.1 in 2003, and up from 35.4 percent in 1990. Women age 15 through 19 accounted for 7.1 percent of births, up from 6.4 in 2003, and down from 8.5 percent in 1990.

BIRTH WEIGHT

The median birth weight for all resident births in 2004 was, 3430 grams (7 pounds, 9 ounces). Low birth weight infants are those born weighing less than 2,500 grams (5 pounds 8 ounces). They are much more likely than heavier babies to suffer short and long term disabilities, and to die in infancy. In 2004, 6.4 percent of Vermont resident births were low birth weight (Table B-16) and 0.9 percent were very low birth weight (less than 1,500 grams or 3 pounds 5 ounces). The U.S. white low birth weight rate for 2004 was 7.2 percent. The Vermont low birth weight rate remains above the *Healthy Vermonters 2010* goal of 5.0 percent and very low birth weight rate is at the *Healthy Vermonters 2010* goal of 0.9 percent.

Low birth weight rates vary by age groups (Table B-16): in Vermont the low birth weight rate among women under age 20 was 9.9 percent, compared to 6.2 percent of births among women age 20-29 and 6.1 percent of births among women age 30 and older.

Infant birth weight is also positively associated with maternal weight gain: mothers who do not gain adequate weight during pregnancy are more likely to deliver low birth weight infants. On the other hand, there are risks associated with gaining too much weight including delivery complications, maternal and infant obesity. Although the weight gained by 18.8 percent of Vermont mothers in 2004 fell below the range recommended by the Institute of Medicine, 48.2 percent gained above the recommended range (Table B-31). Please refer to Appendix B for further information on the guidelines.

The single most important preventable risk factor for low birth weight is smoking during pregnancy. The low birth weight rate among women who smoked cigarettes during their pregnancy was 11.5 percent compared to 4.5 percent among women who did not smoke during pregnancy (Table B-28). About one in five women reported smoking during their pregnancy in 2004, and among those who smoked before pregnancy or during the first trimester, 28.3 percent quit.

PRENATAL CARE

Early, comprehensive, and high quality prenatal care is essential for a healthy pregnancy and birth. Through prenatal care, pregnant women are screened for medical conditions and counseled on nutrition, behavioral risks (such as using tobacco and alcohol), and domestic violence.

In 2004, 90.0 percent of the babies were born to mothers who began prenatal care in the first three months of pregnancy (Table B-20). The *Healthy Vermonters 2010* goal for first trimester prenatal care is 90 percent. While the 2004 percentage of women receiving first trimester prenatal care represents a slight decrease from the 2003 percentage of 90.6, in general the percentage of women receiving first trimester prenatal care has been increasing slowly, but steadily, since 1987. The percent of U.S. white births involving mothers who began prenatal care in the first trimester was 85.4 in 2004.

The proportion of births in 2004 to Vermont mothers who delayed care to the third trimester or received no prenatal care was 1.5 percent, down slightly from 1.6 percent in 2002 and 2003. The proportion of women receiving late or no prenatal care in 2004 was 3.2 percent for U.S. white mothers. As in previous years, the age of the mother is closely associated with the time of entry to prenatal care with young women seeking care later than older women.

We added a new table in 2002's report: (Table B32) – "Adequacy of Prenatal Care by Age of Mother". The Adequacy of Prenatal Care Utilization (APNCU) Index, developed by Milton Kotelchuck, Ph.D., characterizes the adequacy of timing of entry into prenatal care, along with the adequacy of the number of received prenatal care visits. Dr. Kotelchuck's algorithm is based on recommendations from the American College of Obstetricians and Gynecologists (ACOG), and it utilizes the month prenatal care began, the number of prenatal care visits, and adjusts for the infant's gestational age.

Based on the APNCU Index, in 2004, 88.7 percent of Vermont resident mothers received at least adequate prenatal care, which is higher than the U.S. 2004 proportion of 75.2. The percent of Vermont mothers who received inadequate care was 5.6, which is lower than the U.S. percent of 11.2 in 2004. Teen mothers had the highest percent of inadequate care while mothers 30 and older had the highest percent of adequate plus intensive care.

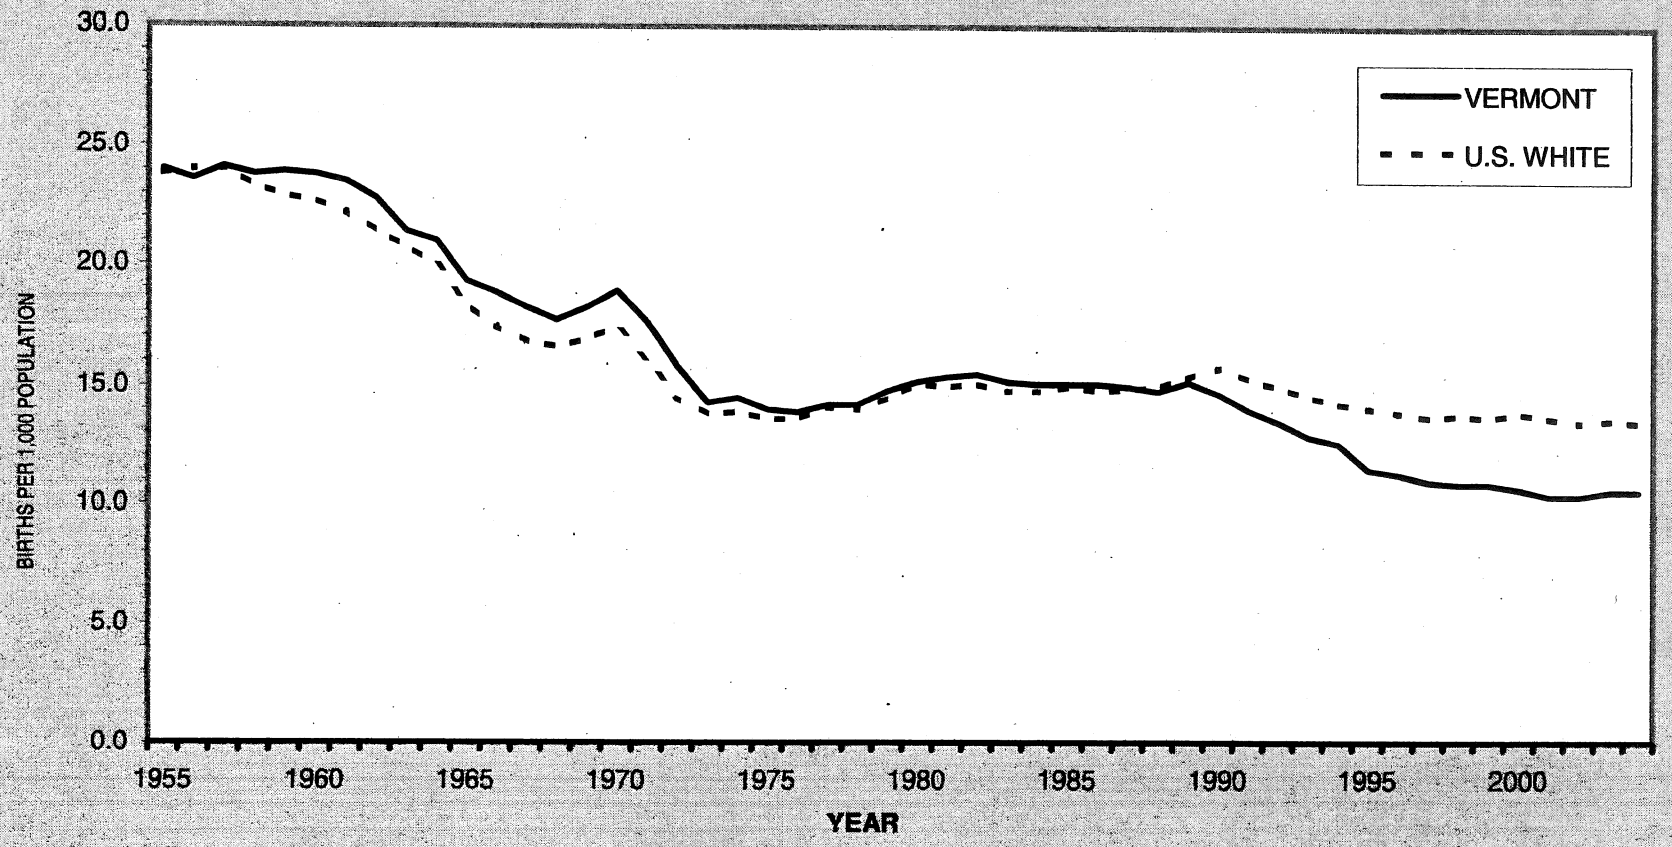
MEDICAL RISK FACTORS

Of the births in 2004, 59.2 percent of mothers had no reported medical risk factors for pregnancy (Table B-29). Of those with medical risk factors reported, the most common were pregnancy-associated hypertension, diabetes, acute or chronic lung disease, previous pre-term or small-for-gestational-age infant, and anemia. In 2004 54.0 percent of births had no complications of labor and/or delivery reported. Of those with complications, the most common complications of labor and/or delivery were dysfunctional labor, fetal distress, meconium, premature rupture of membrane, and breech/malpresentation.

DELIVERIES

Of babies born in Vermont hospitals in 2004, 25.0 percent were delivered by cesarean section (Table B-27) compared to 28.8 percent for U.S. white women in 2004. The primary cesarean section rate was 17.7 percent in Vermont for 2004, compared to 17.8 percent for white mothers nationally in 2004. Of mothers delivering in Vermont hospitals in 2004 who had a previous delivery by cesarean section, 17.3 percent had vaginal births, compared to 8.9 percent for U.S. white mothers in 2004.

Figure 6
VERMONT AND U.S. WHITE BIRTH RATES, 1955-2004



Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1.
1955 to 1979 calculated by race of child; 1980 and later calculated by race of mother.

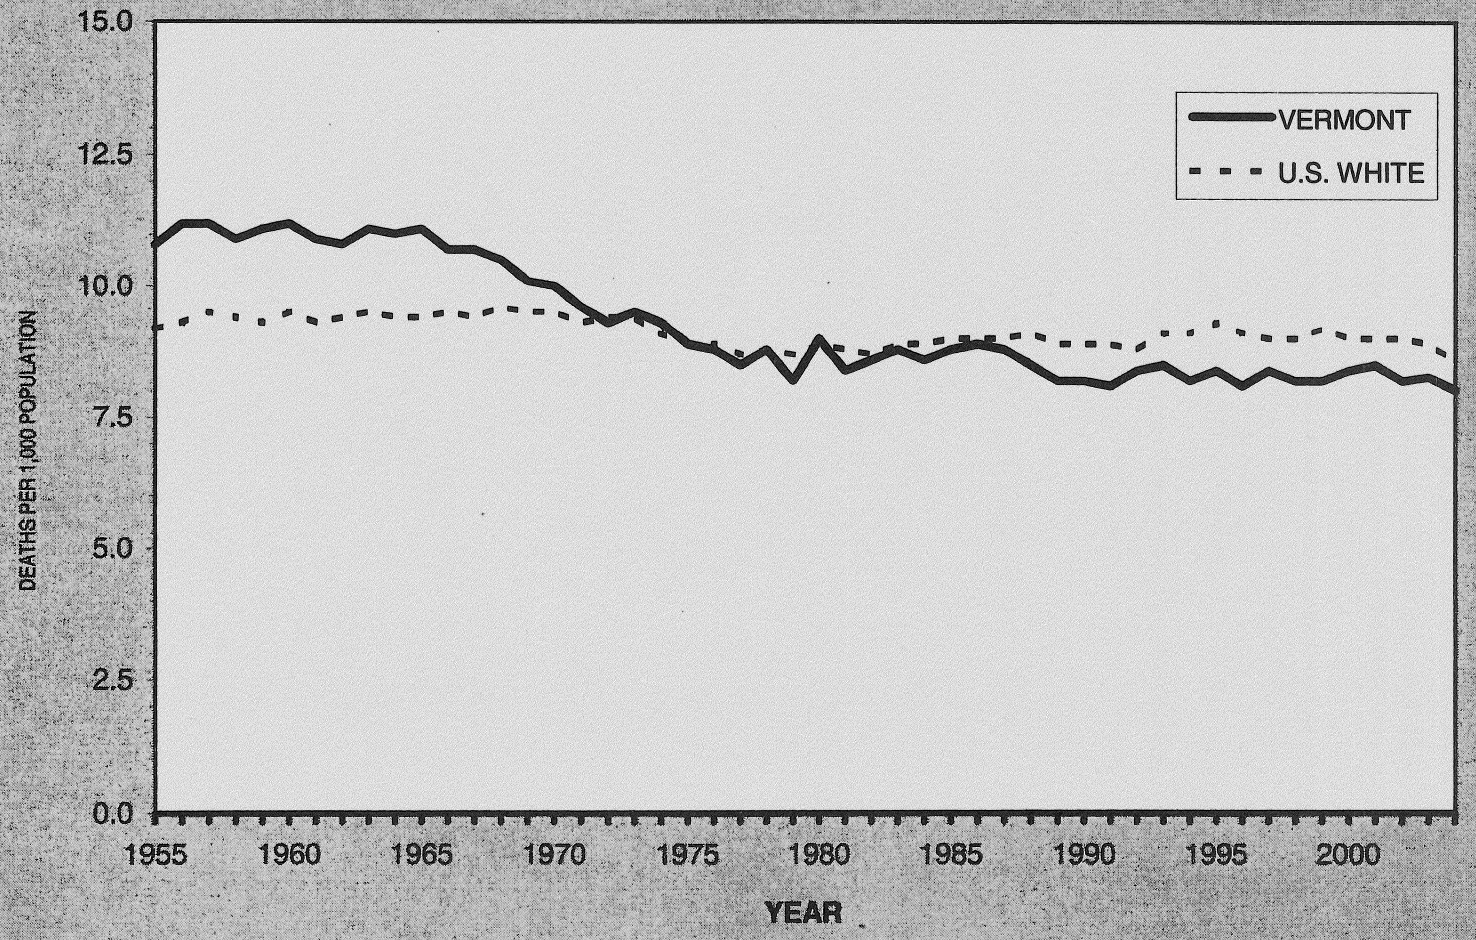
Deaths

Figure 9

VERMONT AND U.S. WHITE CRUDE DEATH RATES
1955-2004



Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1.

DEATHS

There were 4,989 resident deaths in 2004, 133 less than in 2003. The crude death rate decreased to 8.0 per 1,000 population. The death rate has fluctuated between 8.1 and 8.5 since 1988; prior to then it had been slowly declining from 11.2 in 1960, to 10.0 in 1970, down to 9.0 in 1980. The Vermont crude death rate was slightly higher than the U.S. white crude death rate until 1970 when the rates converged and remained similar through 1980. Since 1981, Vermont's death rate has been slightly lower than the U.S. white rate. The U.S. white rate for 2004 was 8.6. Comparisons are made to the U.S. white rate because 99.6 percent of Vermont residents who died in 2004 were white (Table C-9).

For the past 40 years, the three leading causes of death in Vermont have been heart disease, cancer and stroke. Heart disease and cancer accounted for 50.1 percent of the deaths in 2004 (Table C-11). The heart disease crude death rate peaked in the 1960's at 439.5 deaths per 100,000 population. Since then, the rate has declined, and was 206.8 per 100,000 in 2004. The crude death rate from stroke (or cerebrovascular diseases), the third leading cause, has also decreased significantly from a peak of 131.9 in the early 1960's to 48.6 in 2004 (Table C-1). In contrast to the dramatic declines in the rates for heart disease and stroke, the crude death rate for cancer (or malignant neoplasms) rose steadily over the past few decades from 188.1 in the period from 1979 to 1981 to 204.0 in 2001, before decreasing to 195.6 in 2003 and to 195.0 in 2004. This increase is in part a result of the aging population and the continued rise in crude death rates for lung cancer (44.7 in 1979-81, to 51.4 in 1994-96, to 56.5 in 2001).

Chronic lower respiratory disease (formerly referred to as chronic obstructive pulmonary disease) has been the fourth leading cause of death in Vermont since 1985. The crude death rate from this cause increased from 33.0 in the period from 1979 to 1981 to 50.9 in 2000, then decreased to 48.8 by 2003, and again in 2004 to 47.8

Accidents (or unintentional injuries) have been the fifth leading causes of death in Vermont since 1999. The crude death rate from accidents peaked at 58.4 in the period from 1969 to 1971 and declined to 31.3 in 1994 to 1996. Since the mid 1990's however, the death rate from accidents has gradually increased to 40.6 in 2004.

The crude death rate from Alzheimer's disease steadily increased throughout the 1990's and 2000's, moving up from the tenth to the seventh leading cause of death in 1999. In 2004, Alzheimer's disease became the sixth leading cause of death, with a crude rate of 27.8.

Diabetes dropped from the sixth to the seventh leading cause of death in Vermont in 2004; however, in general Vermont has experienced an increasing trend in the crude death rate from diabetes over the past 10 years. The rate has moved up from 22.0 in the period 1989 to 1991 to 26.9 in 2000 and 29.6 in 2003, before declining to 24.0 in 2004.

After slipping from the ninth to the tenth leading cause of death in Vermont in 2001, intentional self-harm (or suicide) returned to the ninth position in 2002 and moved up to the eighth position in 2004, with a rate of 14.6. Influenza and pneumonia slipped to the ninth leading cause in 2004, with a crude rate of 13.8 deaths per 100,000.

In 2004, nephritis/nephrosis or kidney disease returned to the list of ten leading causes of death in Vermont in the tenth spot with a crude rate of 9.5 deaths per 100,000 population.

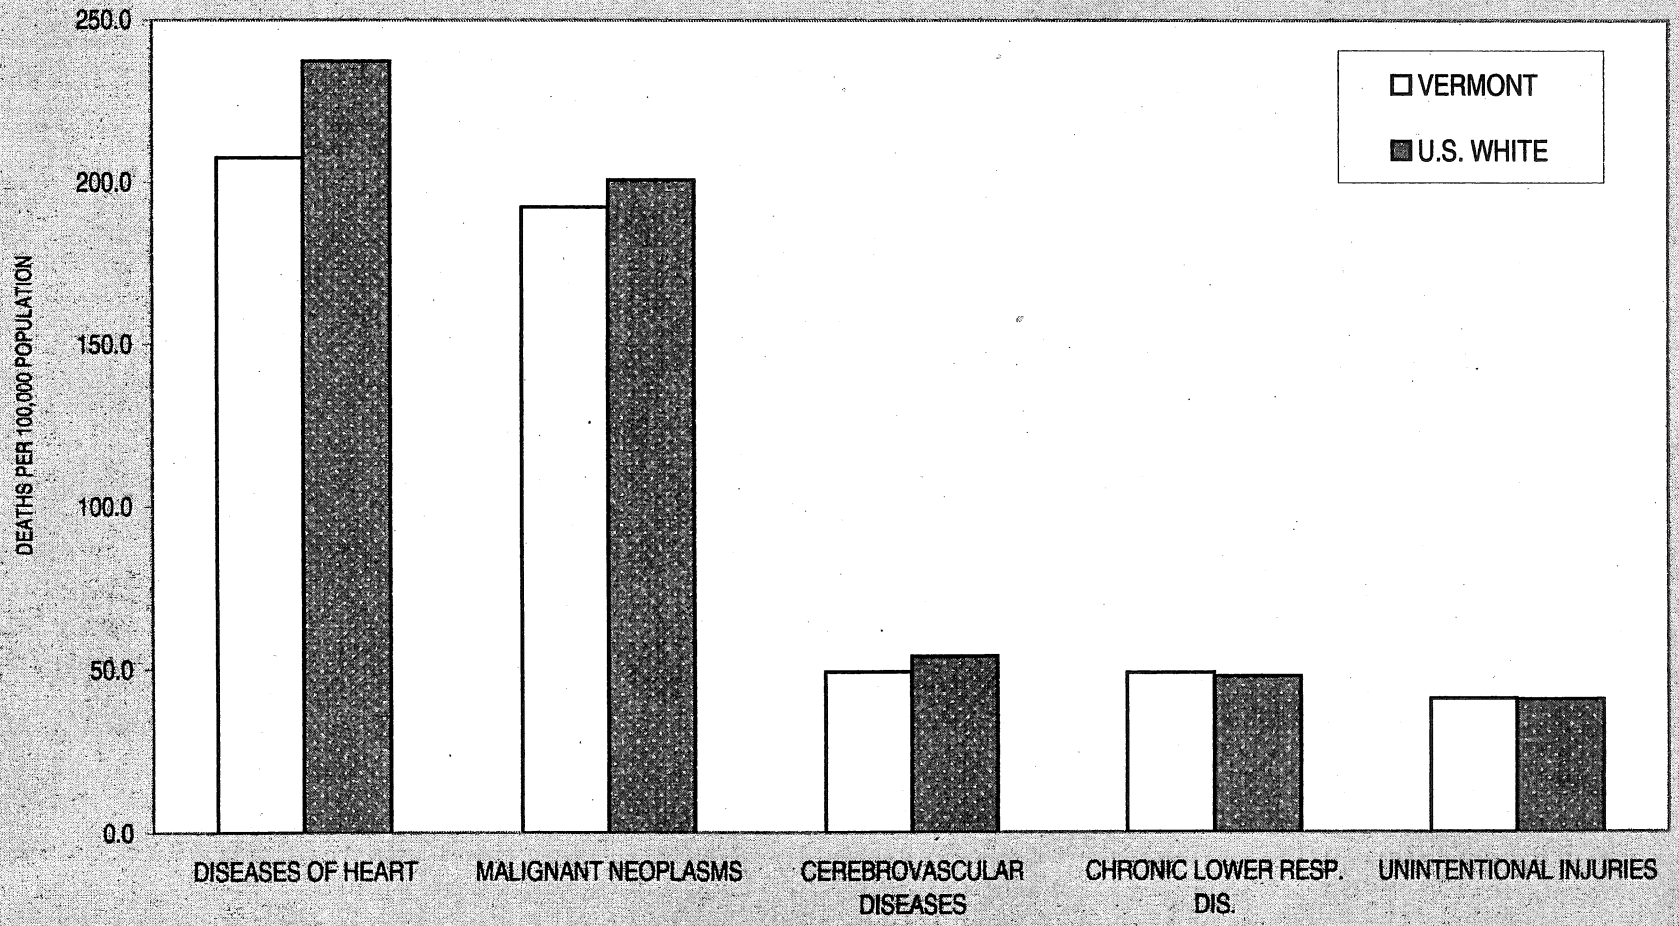
The leading causes of death varied with age (Table C-2) and (Table C-14). Unintentional injuries were the leading cause of death for people age 15 to 44. Cancer was the leading cause of death, followed by heart disease for 45-74 year olds. At ages 75 and higher, the causes were reversed with heart disease as the leading cause, followed by cancer.

Death rates dramatically increase after age 75. People age 75 and over accounted for over 61 percent of total deaths, but comprised only 6.4 percent of the total population. Except for accidents and influenza and pneumonia, the leading causes of death in this age group are all chronic diseases.

The leading causes of death varied by sex as well (Table C-1) and (Table C-11). The top two causes for males and females were the same: heart disease and cancer. Chronic lower respiratory diseases, accidents and cerebrovascular diseases ranked third, fourth, and fifth for males while cerebrovascular diseases, chronic lower respiratory diseases and alzheimer's disease were the third, fourth, and fifth leading causes of death for females. Diabetes and suicide tied for the sixth leading cause of death among males while accidents were ranked sixth for females. The seventh leading cause for females was diabetes. Alzheimer's disease, influenza and pneumonia, and nephritis/nephrosis were the eighth, ninth and tenth leading causes for males. Influenza, nephritis/nephrosis and suicide were ranked eighth, ninth and tenth among females.

Deaths occurring in a hospital accounted for 42.2 percent of Vermont resident deaths (Table C-21), down from 62 percent in 1980 and 53 percent in 1990 but slightly higher than 41.2 in 2000. In 2004, 23 percent of Vermont resident deaths occurred at home, and 24.7 percent occurred in a nursing home.

Figure 10
FIVE LEADING CAUSES OF DEATH IN 2004, FOR VERMONT AND U.S. WHITE POPULATION



Vermont death rates are age-adjusted to the 2004 U.S. white population. U.S. white rates are the 2004 crude death rates.

(1) CAUSE OF DEATH IS CODED BY THE INTERNATIONAL CLASSIFICATION OF DISEASES. DEATHS IN 1979 TO 1998 WERE CODED ACCORDING TO ICD-9. EFFECTIVE JANUARY 1, 1999 DEATHS WERE CODED ACCORDING TO ICD-10. SINCE SIGNIFICANT CHANGES WERE MADE IN ICD-10, THE CODE NUMBERS FOR ICD-9 AND ICD-10 ARE GIVEN IN ADDITION TO COMPARABILITY RATIOS WHICH HAVE BEEN APPLIED TO THE EARLIER RATES TO MAKE THEM COMPARABLE TO THE ICD-10 RATES.

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1.

INFANT DEATHS, FETAL DEATHS, ABORTIONS AND PREGNANCIES

INFANT DEATHS

In 2004, there were 29 resident infant deaths for a rate of 4.4 infant deaths per 1,000 live births. This is the second lowest rate ever in Vermont (Table A-1). The rate is just below the *Healthy Vermonters 2010* goal of 4.5, and is lower than the 2004 U.S. white rate of 5.7. Comparisons are made to the U.S. white rate because all of the Vermont resident infant deaths were to whites in 2004. The Vermont infant mortality rate steadily declined from 24.0 in 1960 to 5.88 per 1,000 live births in 1991. The rate then fluctuated for most of the 1990s before again showing downward trend in recent years.

Nineteen (65.5 percent) of the infant deaths occurred during the neonatal period, that is before the infant became 28 days old (Table D-6). The neonatal death rate was 2.9 deaths per 1,000 live births (Table D-5), lower than the 2004 U.S. white neonatal death rate of 3.8. The Vermont neonatal death rate has decreased over the past four decades from 18.6 in 1960, to 14.4 in 1970, to 6.2 in 1980, to 3.6 in 1990 (Table A-1). The rate increased through the nineties to a high of 5.9 in 1998 before sharply dropping to 3.2 in 1999. After increasing to 3.8 in 2000, the rate decreased to 3.6 in 2001, and 2.8 in 2002 – the lowest rate ever in Vermont.

The leading causes of infant deaths (Table D-9) were birth defects (7), and maternal complications (4).

One of the most important risk factors in infant mortality is low birth weight (Table D-7). Of resident infants who died in 2004, 58.6 percent had a birth weight less than 2500 grams (5 pounds 8 ounces), while 6.4 percent of all resident births were low weight. The infant mortality rate for low weight births was 39.6 deaths per 1,000 live births. Age of mother is also related to infant mortality (Table D-5). From 2002 to 2004, the infant mortality rate for mothers 15 through 19 years of age was 7.1, and for mothers age 20 through 24 the rate was 5.5. The 15-19 year old maternal age group also had the highest neonatal death rate at 4.9.

FETAL DEATHS

Unlike births and deaths, reports of fetal deaths and abortions are not shared among states. Therefore, statistics concerning these events reflect occurrences in Vermont only and do not include Vermont resident fetal deaths and abortions that occurred in other states.

There were 22 resident fetal deaths in 2004 (Table D-1) for a rate of 3.3 per 1,000 live births and fetal deaths, up slightly from 3.2 per 1,000 live births and fetal deaths in 2003 (Table D-5). Of the fetal deaths in Vermont, 16 weighed less than 2500 grams (Table D-7). From 2002 to 2004, the fetal death rates were highest in the youngest and oldest age groups: 6.3 per 1,000 live births for women age 15 to 19, 4.7 for women age 35 to 39 and 3.3 for women age 40 to 44 (Table D-5).

VERMONT ABORTIONS

There were 1734 abortions performed in Vermont in 2004, the third consecutive increase in number, after declining each year since 1989. Vermont residents accounted for 1500, or 86.5 percent. This represents a rate of 11.8 per 1,000 women age 15 to 44.

The abortion ratio is the number of resident abortions occurring in Vermont times 1,000, divided by the total resident live births. The abortion ratio for 2004 was 227.4 abortions per 1,000 live births, the highest ratio since 1998. The most recent U.S. white abortion ratio available was 165 per 1,000 live births, in 2003.

Women age 20 to 24 had the highest *age-specific* abortion rate, of 25.5 per 1,000 women, followed by women age 25 to 29 at 19.9. First trimester abortions accounted for 95.2 percent of all Vermont abortions and 68.3 percent of all Vermont abortions were for pregnancies of less than 9 weeks duration (Table E-5). See Appendix B for the method used to compute the number of weeks of gestation.

VERMONT RESIDENT PREGNANCIES

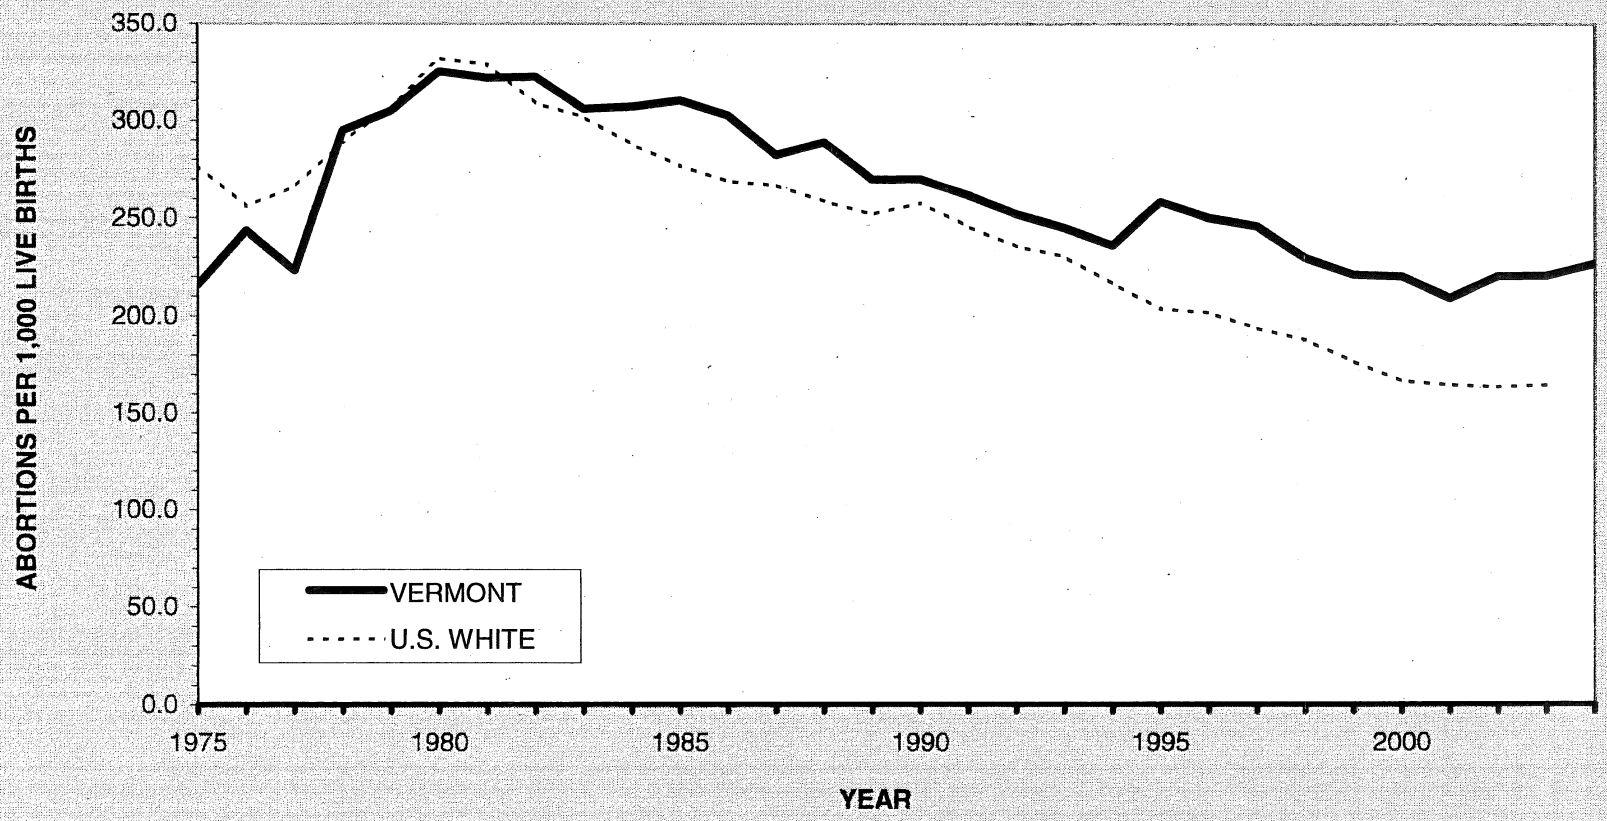
The pregnancy rate is derived by adding live births, fetal deaths and abortions. The pregnancy rates presented in this report underestimate the actual number of pregnancies for two reasons. First, Vermont resident abortions and fetal deaths that occur out of state are not reported to us. Second, by statute, fetal deaths prior to 20 weeks gestation are not reportable. Since residents of some counties may be more likely to use out-of-state services, the extent of these underestimates may differ among counties.

In 2004, the pregnancy rate in Vermont was 63.8 pregnancies per 1,000 women age 15 to 44 (Table F-1), compared to 62.2 in 2003, 60.3 in 2002, and 84.2 in 1980. The pregnancy rate peaked at 127.6 in 1960 and dropped steadily until 1995, and has been fairly stable since then (Table A-1).

The 2004 teen pregnancy rate was 33.1 pregnancies per 1,000 women age 15 to 19 years (Table F-1). This is up from 31.5 in 2003, although in general the teen pregnancy rate has been decreasing since 1991. In 2004, the highest pregnancy rate was seen in women 25 to 29 years of age at 123.1, followed by the 30 to 34 age group at 105.4. The lowest rate was for women age 35 to 44 at 27.9.

Figure 12

VERMONT AND U.S. WHITE ABORTION RATIOS
1975 - 2004



Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. White 2004 ratio is not available at this time. U.S. ratios are based on reporting states.

2004 TOTAL	3.3	5.9	2.9	4.4

NOTES:

Fetal and *perinatal* death rates are the number of resident fetal deaths and perinatal deaths per 1,000 resident live births and fetal deaths.

Neonatal and *infant* death rates are the number of resident neonatal and infant death rates per 1,000 resident live births.

Data for the years 2002-2004 have been combined to produce more stable rates.

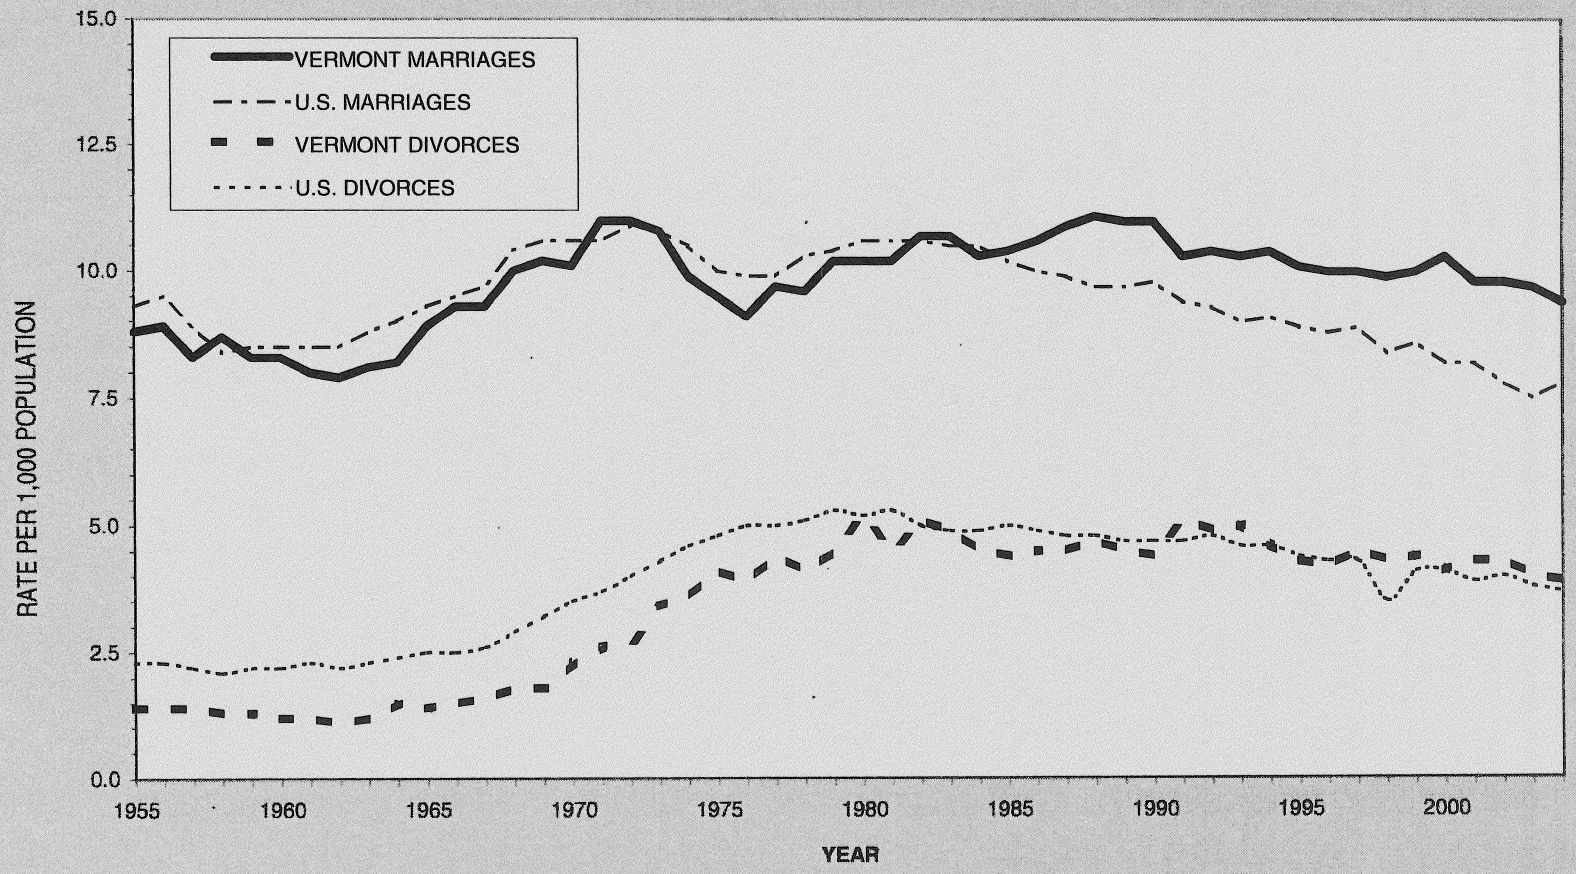
Marriages and Divorces

Figure 13

VERMONT AND U.S. MARRIAGE AND DIVORCE RATES
1955 - 2004



Data points for the U.S. population can be found in Appendix D. Vermont data points can be found in Table A-1.

MARRIAGES & DIVORCES

MARRIAGES

In 2004, 5,836 marriages were performed in Vermont, 152 less than in 2003. The 2004 Vermont rate was 9.4 per 1,000 of population, the lowest rate in Vermont in more than 20 years, but higher than the 2004 U.S. provisional rate of 7.8. Marriages between two out-of-state residents accounted for 33.0 percent of the marriages in Vermont (Table G-2).

There was the usual seasonal variation with more marriages occurring in summer than in any other season. August (887) was the most popular month for marriages in 2004 (Table G-7).

Just over half (52.3 percent) of the marriages were firsts for both bride and groom (Table G-5). For the brides, 63.5 percent were first marriages, and for the grooms, 63.1 percent were first marriages. Remarriages for both bride and groom accounted for 25.6 percent of marriages in Vermont.

The percentage of civil ceremonies decreased to 60.0 percent in 2004 (Table G-8). This is the first decrease since 1990.

DIVORCES

There were 2,452 divorces granted in 2004, a decrease of 43 from 2003. This represents a rate of 3.9 per 1,000 residents, slightly higher than the 2004 U.S. provisional rate of 3.7.

The median length of marriages ending in divorce was 9 years 6 months, with a range of 1 month to 50 years 0 months. Almost fifty-six percent of divorces followed a separation of a year or longer (Table H-3). The median age at the time of divorce was 39 for women with a range of 18 to 84 years. The median age at the time of divorce was 41 for men with a range of 19 to 91 years.

In 2004, 49.4 percent of divorces involved at least one child under the age of 18 (Table H-5), and a total of 2,034 children (Table H-7) were involved in a divorce. This represents an estimated 1.5 percent of all children residing in Vermont.

Civil Unions and Dissolutions

CIVIL UNIONS

In 2004, 712 civil unions were established in Vermont, down from 1,397 in 2003. The highest number (83) occurred in June.

Civil unions involving out-of-state residents accounted for 78 percent of the total number of civil unions (Table I-2), down from almost 90 percent in 2003. The states with the largest number of residents who established civil unions were New York and Florida (Table I-1). The largest number of Vermont residents who established civil unions resided in Chittenden County (Table I-2).

Seventy-four percent of the civil unions were between female partners, the same as in 2003, and the most common age group for male partners was 35 to 39, and for female partners it was 40 to 44 (Table I-4). Civil union partners tend to be highly educated: 52 percent completed at least four years of college (Table I-5).

Table I-6, shows the total number of civil unions or marriages, including the current civil union, that each person has been a party to during their lives. For 77 percent of the civil union partners, this was their first union, or marriage.

DISSOLUTIONS

The dissolution of civil unions follows the same procedures, same requirements, rights, and obligations as divorces. There were 36 dissolutions in 2004.

APPENDIX B
OBSTETRIC DATES AND INTERVALS AND WEIGHT GAIN RECOMMENDATIONS

MONTH PRENATAL CARE BEGAN

In 1988, the Vermont Department of Health adopted the National Center for Health Statistics method of calculating the month prenatal care began. This allows Vermont data to be more easily compared to national data, and eliminates any errors that could be introduced by hospitals using different reporting methods.

The calculation is based on the month of last menses and the month of the first prenatal visit. For example, if the date of last menses was January 1 and the date of first prenatal visit was March 10, the calculation shows that prenatal care began in the second month.

GESTATIONAL AGE

Live Births and Fetal Deaths: The methodology used to determine gestational age matches that used by the National Center for Health Statistics.

Two measures of gestational age are available from the standard certificates. The standard certificates collect information on the first day of the mother's last menstrual period (LMP). The interval between the LMP and the date of birth is the *calculated* gestational age. The standard certificate also collects a *clinical estimate* of gestation.

The primary measure used by NCHS to determine the gestational age of the newborn is the *calculated* weeks of gestation. However this method is subject to error due to imperfect maternal recall and to misidentification of the LMP. Therefore an edit is run that checks whether the calculated weeks of gestation is consistent with the infant's plurality and birth weight. If the birth weight is within the bounds for the calculated weeks of gestation, then the *calculated* weeks of gestation becomes the assigned gestational age. If the birth weight is not within the bounds for the calculated weeks, but it is within the bounds for the clinical estimate of gestation, then the *clinical estimate* of gestation is assigned as the gestational age. If the birth weight does not fit within the bounds for either the calculated weeks of gestation or the clinical estimate of gestation, the gestational age is designated "unknown". If the month and year for LMP are given, but the day is missing, the gestational age is *imputed* using the gestational age of the preceding record that has complete data with the same computed month of gestation and the same 500-gram birth weight interval.

In 2004, 94.3 percent of the Vermont resident records used the *calculated* weeks, 5.7 percent used the *clinical estimate* of the weeks, and the remaining 5 records were designated "*unknown*" gestational ages.

Abortions: Gestational age is calculated from the date of last normal menses and date of abortion. The clinically estimated weeks is used if the date of last normal menses is unknown, or if the calculated weeks and the clinically estimated weeks are more than two weeks apart.

NUMBER OF PRENATAL VISITS

Since 1985, hospitals report the date of the first and last recorded prenatal visits and the number of visits recorded. In 1986, a procedure was adopted for births of 36 or more weeks of gestation with less than 20 reported visits, and whose last reported visit was within four weeks of delivery. In these cases the Vermont Department of Health records the number of prenatal visits reported by the hospitals **plus** one visit for every week between the date of the last recorded visit and the delivery date. This procedure was stopped in 2004, and the hospital reported number of visits is used in all analyses.

WEIGHT GAIN DURING PREGNANCY

The weight gain guidelines reflected in this report were taken from Nutrition During Pregnancy, Institute of Medicine, National Academy of Sciences, 1990. According to this source, the recommended weight gain for very overweight/obese women (pre-pregnancy BMI > 29.0) is "at least 15 pounds". In our 2001 report, we used a range of 7-15 pounds for this category to coincide with the recommendations used by our WIC program. However, beginning in 2002, the recommended weight gain range for very overweight/obese women was increased to 15-25 pounds to more closely match other reports produced at the Vermont Department of Health. The recommendations are now as follows:

PRE-PREGNANCY BMI	RECOMMENDED WEIGHT GAIN
< 19.8	28 - 40 lbs
19.8 - 26.0	25 - 35 lbs
26.1 - 29.0	15 - 25 lbs
> 29.0	15 - 25 lbs
Multiple births	35 - 45 lbs

APPENDIX C

DEFINITIONS OF THE 113 SELECTED CAUSES OF DEATH

Causes of Death	Category Numbers According to the International Classification of Diseases	
	Tenth Revision	Ninth Revision Adapted
Salmonella infections	A01-A02	002-003
Shigellosis and amebiasis	A03, A06	004, 006
