

Timeframe: 10/08/2023 – 10/14/2023

- The Influenza-like Illness (ILI) activity level is **minimal** in Vermont. For a description of national influenza activity levels, please [visit CDC's page](#).
- COVID-19 and other respiratory illnesses are also being spread during this flu season. Vaccination and respiratory illness prevention strategies are recommended. Follow these links for up-to-date [Vermont](#) and [national](#) COVID-19 data.
- CDC has launched a new [Weekly Viral Respiratory Illness Snapshot](#) to provide a summary of national key viral respiratory illness findings for COVID-19, influenza and RSV including additional information and figures.

Syndromic Surveillance

Vermont Emergency Room and Urgent Care Visits for Influenza-like Illness or Diagnosed Influenza

†The definition of Influenza-like Illness (ILI) was updated in September 2021 to no longer exclude patients with another diagnosed non-influenza illness. The 2020-21 season's ILI data are not directly comparable to subsequent seasons due to this change.

Illness Definitions

Influenza-like Illness (ILI): determined using the patient's chief complaint and/or discharge diagnosis. ILI is the presence of a fever equal to or exceeding 100°F with the addition of cough or sore throat. As of 2021, the ILI definition no longer excludes patients with another diagnosed non-influenza illness.

Influenza (Flu): determined by the patient's chief complaint of a fever with the addition of cough or sore throat and a discharge diagnosis of influenza.

ILINet Sentinel Provider Data

This surveillance data is based upon reports submitted by ILINet, a nationwide group of medical offices that act as influenza sentinels. Sentinel providers report the number of patients with an influenza-like illness (ILI) seen by their practices each week.

Age Distribution of Patients with an Influenza-like Illness

About 0.49% of visits were due to influenza-like illness among Vermont ILINet providers reporting this week. This is an increase from 0.35% the previous week.

Laboratory Data

The **National Respiratory and Enteric Virus Surveillance System (NREVSS)** collects data on the number of PCR flu tests performed by participating Vermont labs and how many were positive. This helps determine flu activity in the community.

0.27% of PCR tests run this week were positive, a decrease compared to 0.82% the previous week. During the 2023-24 season, 0.54% of flu PCR tests reported through NREVSS have been positive. Positive results reported through NREVSS this season have been influenza A.

Flu Surveillance Report

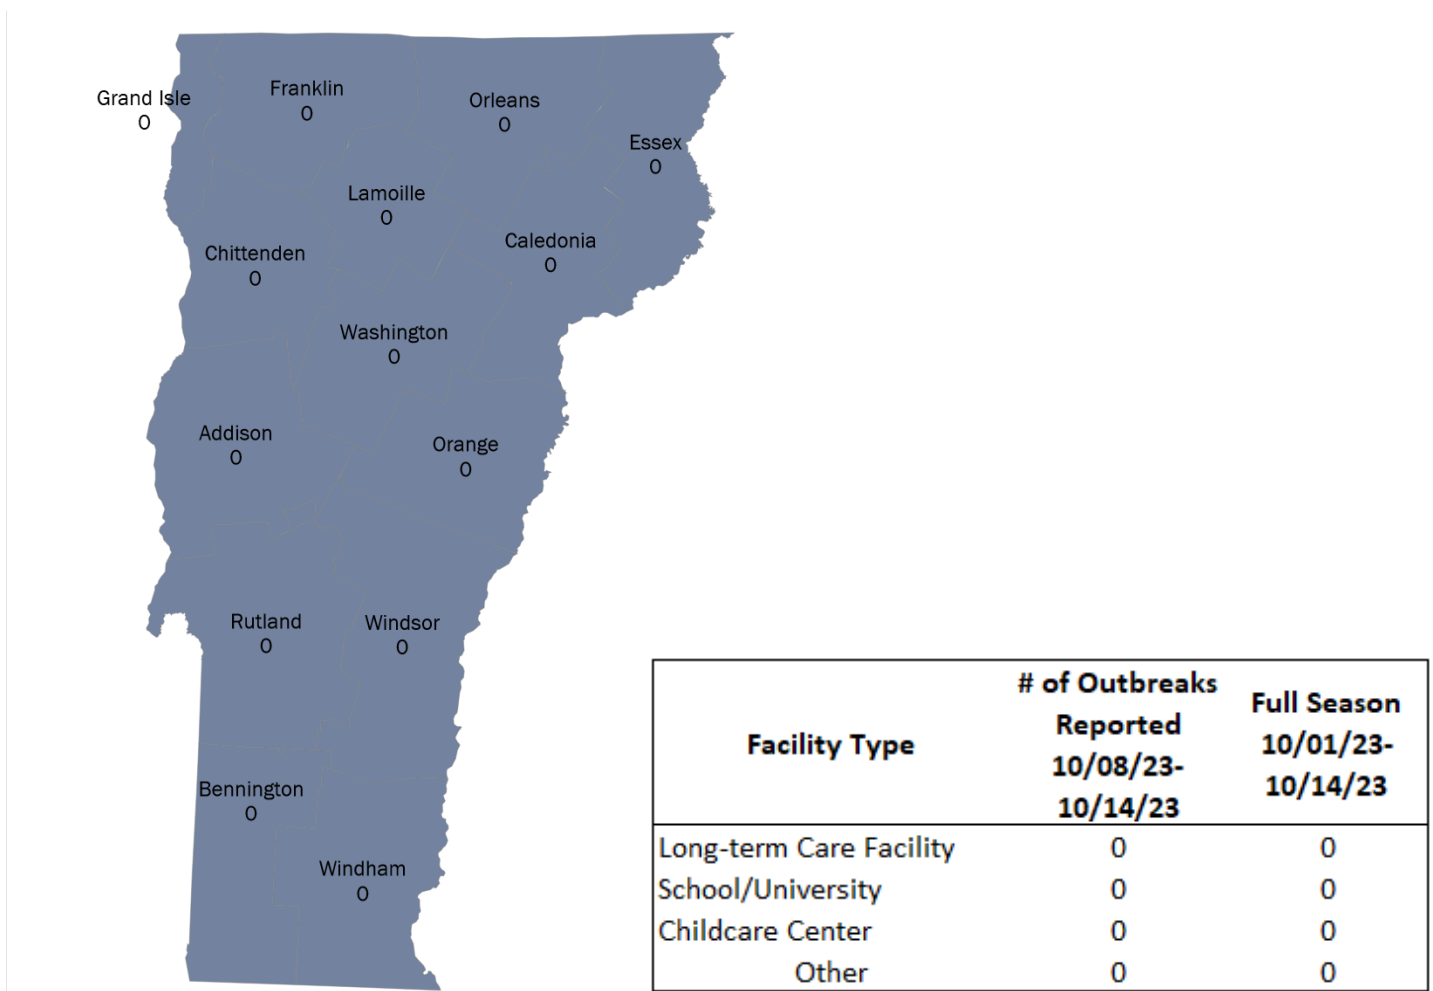

The **Health Department Lab** performs surveillance subtype testing to determine the type of flu, for example H3, H1N1, etc. This information helps determine the circulating virus strains, not the spread of flu virus.

Type and Subtype	This week: 10/08/23-10/14/23	Season so far: 10/01/23-10/14/23
Flu A H3	0	1
Flu A H1pdm09	0	1
Flu B	0	0

Reported Outbreaks

Institutional outbreaks of flu or influenza-like illness (excluding respiratory illnesses not caused by influenza viruses, e.g., COVID-19) are reportable to the Health Department.

Number of Influenza-like Illness and Influenza Lab Confirmed Outbreaks, 10/08/2023 – 10/14/2023
