# Vermont Vital Statistics Annual Report

# 2001

State of Vermont  
James H. Douglas, Governor

Agency of Human Services  
Charles P. Smith, Secretary

Department of Health  
Paul E. Jarris, MD, MBA, Commissioner

**April 2003**

*Printed on recycled paper.*

We gratefully acknowledge the contributions of the medical records staff, physicians and midwives, funeral directors, lawyers, and court clerks for their help in collecting and providing us with this data.

We also recognize the 251 town and city clerks, who are our local registrars. Without them, these analyses of Vermont's vital statistics would not be possible.

# Introduction

**Figure 1  
VERMONT COUNTY MAP**

## THE VERMONT VITAL STATISTICS SYSTEM

Statewide vital registration began in Vermont in 1857, when the General Assembly passed a bill requiring that towns report all births, marriages, and deaths occurring in their jurisdiction to the Secretary of State. The legislature also required periodic publication of tables from the reports. This volume is the latest in a series of publications begun in 1857. Historically, the information contained on vital records has served as an important tool for public health officials and others by providing a picture of the general health of the population. Recognizing its importance, in 1896 the Legislature transferred responsibility for the vital statistics system to the newly formed Board of Health, the forerunner of the Vermont Department of Health. The Health Department has retained this responsibility to the present day.

Until recently, the Vermont vital statistics system monitored six types of vital events: births, deaths, marriages, divorces, fetal deaths, and abortions. With the passage of Act 91 in 2000, the establishment and dissolution of civil unions were added to the list. A civil union is a legal relationship that provides for same-sex couples in Vermont all the benefits, protections, and responsibilities under law as are granted to spouses in a marriage.

Each type of vital record follows a different path before being used to produce the statistics published here.

**Births:** When a birth occurs, the physician, midwife, or other birth attendant is required to complete a birth certificate and file it with the town clerk in the town of birth within 10 days. For hospital births, it is usually the medical record's staff who complete the birth certificate. The completed birth certificate is recorded and filed in the town where the birth took place, and a certified copy is sent to the Health Department.

**Deaths:** Although a physician is responsible for filing the death certificate, the job may be, and often is, delegated to the funeral director. Most of the information needed to complete the death certificate is obtained from the family of the deceased. A physician, however, must complete the cause of death information and sign the death certificate. The funeral director files the completed certificate with the town clerk who sends a certified copy to the Health Department.

**Marriages and civil unions:** When a couple wishes to marry or establish a civil union in Vermont, they provide a town clerk with the information needed to complete the license. The couple takes the license to an officiant, who signs and dates it, and returns it to the town clerk. The town clerk records and files the certificate, and sends a certified copy to the Health Department.

**Divorces and dissolutions:** A divorce certificate or certificate dissolving a civil union is initiated by a lawyer or other individual handling the divorce or dissolution. The certificate is filed with the court as part of the divorce or dissolution proceedings. The court keeps the certificate until the decree becomes final, usually three months after the court hearing. When the decree is final, the court clerk signs the certificate and sends it to the Health Department for filing.

**Fetal deaths and abortions:** Reports of fetal death and induced termination of pregnancy (abortion) are sent directly to the Health Department by the physician, hospital, or clinic that performs the procedure. By law, these reports are for statistical purposes only, are not public records, and are destroyed after five years.

In addition to receiving copies of vital records from Vermont town clerks, the Health Department also receives copies of certificates of all Vermont resident births and deaths that occur in other states and in Canada. This allows the Department to do statistical analyses of vital events involving Vermont residents even if the birth or death occurred outside of the state. Health Department staff code and enter all vital records received into a computerized database. Records with unknown or unlikely data are corrected after querying the data provider. A data file containing statistical information from the records is sent to the National Center for Health Statistics to become part of a national database.

## EXPLANATORY NOTES

1. The tables in this bulletin were derived from records of vital events filed at the Vermont Department of Health for calendar year 2001.
2. Rates are based on the 2001 population estimates from Claritas, Inc.
3. Caution must be used in comparing rates due to the small population in Vermont and the small number of events recorded.
4. Rate comparisons throughout are made to the U.S. white population rather than entire U.S. population. This is because only 2.1 percent of the Vermont population were non-white as of the 2000 U.S. Census.
5. If you have questions about the information found in this bulletin, you may contact a statistician at the Vermont Department of Health, 802-863-7300.
6. If you have questions about the population figures found in this bulletin, you may call the Vermont Department of Health to request a copy of *The Population and Housing Estimates*, which also provides information about age groups other than those presented in this publication.
7. The following is a list of Vermont's counties and the county abbreviations that are used in this bulletin.

Addison	ADD	Lamoille	LAM
Bennington	BEN	Orange	ORG
Caledonia	CAL	Orleans	ORL
Chittenden	CHI	Rutland	RUT
Essex	ESS	Washington	WAS
Franklin	FRA	Windham	WDM
Grand Isle	GI	Windsor	WDR

## DEFINITIONS, RATES, AND RATIOS

**ABORTION:** The purposeful interruption of an intrauterine pregnancy with the intention other than to produce a live-born infant or other than to remove a dead fetus, and which does not result in a live birth.

**ABORTION RATE:** Number of resident abortions occurring in Vermont x 1000, divided by the total resident women ages 15 to 44.

**ABORTION RATIO:** Number of resident abortions occurring in Vermont x 1000, divided by the total resident live births.

**AGE ADJUSTMENT:** Age adjusting allows one to compare rates among populations having different age distributions by adjusting the crude rates in each population to a standard population base. In this bulletin, county rates are adjusted using the state population distribution as the standard.

The computation formula is: The sum of (age-specific rate for each age group x standard population in that age group) multiplied by 1000, then divided by the total standard population.

**AGE-SPECIFIC DEATH RATE:** Number of deaths in a specific age group x 1000, divided by the total resident population in a specific age group (using population estimates as of April 1).

**AGE-SPECIFIC FERTILITY RATE:** Number of resident live births to mothers in a specific age group x 1000, divided by the total female population in a specific age group (using population estimates as of April 1).

**AGE-SPECIFIC PREGNANCY RATE:** Number of resident pregnancies to women in a specific age group x 1000, divided by the total female population in a specific age group (using population estimates as of April 1).

**ANNULMENT:** The invalidation or voiding of a marriage, or civil union, which confers on the parties the status of never having been married to each other.

**CIVIL UNION:** A civil union is a legal relationship that provides for same-sex couples in Vermont all the benefits, protections, and responsibilities under law as are granted to spouses in a marriage.

**CIVIL UNION RATE:** Total number of civil unions x 1000, divided by the total resident populations (using population estimates as of April 1).

**CRUDE BIRTH RATE:** Number of resident live births x 1000, divided by the total resident population (using population estimates as of April 1).

**CRUDE DEATH RATE:** Number of resident deaths x 1000, divided by the total resident population (using population estimates as of April 1).

**CUMULATIVE ROW PERCENT:** The total number of cases in the current column plus each previous column in each row, expressed as a percentage of all cases in that row.

**DEATH:** The permanent disappearance of any evidence of life at any time after live birth.

**DIVORCE:** The final legal dissolution of a marriage.

**DIVORCE RATE:** The sum of the number of divorces and annulments, x 1000; divided by the total resident population (using population estimates as of April 1).

**DISSOLUTION:** The final legal dissolution of a civil union.

**FERTILITY RATE:** Number of resident live births to women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44 (using population estimates as of April 1).

**FETAL DEATH:** A reportable fetal death is a death prior to the complete expulsion or extraction from the mother of a product of conception, which has passed through at least the 20th week of gestation or weighs more than 400 grams; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

**FETAL DEATH RATE:** Number of resident fetal deaths x 1000, divided by the total resident live births and resident fetal deaths.

**FETAL DEATH RATIO:** Number of resident fetal deaths divided by total resident live births.

**INFANT DEATH:** Death occurring in the first year of life.

**INFANT DEATH RATE:** Number of resident infant deaths x 1000, divided by the total resident live births.

**LIVE BIRTH:** The complete expulsion or extraction from the mother of a product of conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

**LOW BIRTH WEIGHT:** A baby weighing less than 2,500 grams (5 pounds, 8 ounces) at birth.

**LOW BIRTH WEIGHT PERCENT:** The number of live births weighing less than 2,500 grams divided by the total number of live births.

**MARRIAGE:** The legal union of persons of opposite sex.

**MARRIAGE RATE:** Number of marriages x 1000, divided by the total resident population (using population estimates as of April 1).

**NATURAL INCREASE:** Occurs when the number of births is greater than the number of deaths.

**NEONATAL DEATH:** Death of a live-born infant before the infant becomes 28 days old (up to and including 27 days, 23 hours, 59 minutes from the moment of birth).

**NEONATAL DEATH RATE:** Number of resident neonatal deaths x 1000, divided by the total resident live births.

**OCCURRENCE:** The place where the event actually occurred.

**PERINATAL DEATH:** A fetal death or a death occurring before the infant becomes seven days old (up to and including six days, 23 hours, 59 minutes from the moment of birth).

**PERINATAL DEATH RATE:** Number of resident perinatal deaths x 1000, divided by the total resident live births and resident fetal deaths.

**PLURALITY:** The number of siblings born as a result of this pregnancy.

**PREGNANCY RATE:** Number of resident pregnancies in women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44.

**RESIDENCE:** The usual place of residence for the person to whom the event occurred. For births and fetal deaths, residence is defined as the mother's usual place of residence.

**ROW PERCENT:** The number of cases in each row expressed as a percentage of all cases in that row.

**WEEKS OF GESTATION:** The number of weeks elapsed between the first day of the last menstrual period and the date of delivery.

# Summary and Population

**Figure 2**  
**VERMONT VITAL EVENTS FOR 2001**

Marriages, divorces, civil unions, dissolutions, and abortions displayed above are occurrence data; all other vital events represent resident data.

## SUMMARY STATISTICS

**Occurrence** statistics include all events recorded in Vermont, including those involving visitors living outside Vermont. **Resident** statistics are limited to the events involving people with legal residence in Vermont, including events occurring outside Vermont. In 2001, reports of births and deaths to Vermonters were received from 29 states.

### SUMMARY OF 2001 VITAL EVENTS

	<u>Occurrence Number</u>	<u>Resident Number</u>	<u>Resident Rate</u>
Births	6,150	6,367	10.4/1,000 population
Deaths	5,210	5,202	8.5/1,000 population
Natural Increase	NA	1,165	1.9/1,000 population
Infant Deaths	29	35	5.5/1,000 live births
Fetal Deaths	23	22 <sup>(1)</sup>	3.4/1,000 live births and fetal deaths
Abortions	1,513	1,297 <sup>(1)</sup>	9.9/1,000 women ages 15 to 44
Marriages	5,983	N/A	9.8/1,000 population <sup>(2)</sup>
Divorces	2,637	N/A	4.3/1,000 population <sup>(2)</sup>
Civil Unions	1,875	N/A	3.1/1,000 population <sup>(2)</sup>
Dissolutions	4	N/A	<sup>(3)</sup>

2001 population: 612,308

- 
- (1) Does not include out-of-state occurrences
  - (2) Based on number of occurrences
  - (3) Rate less than 1

## POPULATION

Vermont's population in 2001, was estimated at 612,308. This is a 0.6 percent increase from the 2000 Census count of 608,827.

The largest segment of the population is the 35 to 44-year-old age group, followed closely by the 45-54 age group. The sex distribution of Vermonters shows males outnumbering females up to age 29, females slightly outnumbering males from age 25 to 64, and females outnumbering males by a widening margin as age increases after 65. The age-sex distribution of Vermont is illustrated in Figure 3.

The 2001 population estimates were produced for the Vermont Department of Health by Claritas, Inc. The 2001 estimates were produced before complete age data was available from the 2000 Census, this accounts for the wide variation between the 2001 estimates and the 2000 Census counts for some age groups.

Figure 3

a Population is the census population for those years when the census was taken and is the mid-year estimate for non-census years.  
b Note that mid-year population estimates are revised after each census is taken, so the 1991-1999 population figures and rates in this table differ from those presented in older publications.  
c Rate per 1000 population.  
d Rate per 1000 women ages 15-44  
e Number of pregnancies includes Live Births and Fetal Deaths for 1857 - 1972, and Live Births, Fetal Deaths, and Abortions for 1973 - present.  
f Rate per 1000 Live Births.  
g Events per 1000 Live Births.  
h Data for these years is based on occurrence returns only.  
i 1857 population is the 1860 census population.  
j 1857 was the first year that town clerks were required to report vital events to the Secretary of State and returns for that year are incomplete.  
k The number of pregnancies was incorrectly typed in the 2000 Vital Statistics Annual Report. The 2000 abortion ratio was corrected after the discovery of 39 duplicate records in the 2000 file.

## BIRTHS

In 2001, 6,367 babies were born to Vermont residents. This represents a decrease of 134 births from 2000. The number of babies born to Vermont residents has declined every year since 1989. The crude birth rate in 2001 was 10.4 per 1,000 Vermont residents, compared to 10.7 in 2000 and 10.9 in 1999. The U.S. white birth rate for 2001 was 13.7. Comparisons are made to the U.S. white rate because 98.0 percent of Vermont resident births were to white mothers in 2001 (Table B-5). The Vermont birth rate peaked in 1955 at 24 per 1,000 residents, then dropped for two decades, remained relatively stable from the late 1970's through the 1980's, and has been slowly and steadily decreasing since 1989.

### FERTILITY

Although the crude birth rate is based on the total population, a better measure of birth patterns is the fertility rate which is based on the population of women ages 15 through 44, the peak child bearing years. The 2001 Vermont fertility rate was 48.4 per 1,000 women ages 15 through 44 (Table B-8), a slight decrease from the 2000 rate of 49.7. The U.S. white fertility rate was 65.0 in 2001. The fertility rate in Vermont peaked in 1960 at 126, declined through the 1960's and 1970's, leveled off slightly in the 1980's and has steadily declined since 1989. Age-specific fertility rates have generally declined among the younger age groups, and increased among the older age groups.

FIGURE 5  
AGE-SPECIFIC FERTILITY RATES, SELECTED YEARS 1980-2001

AGES/ YEAR	1980	1990	2000	2001
<b>TOTAL</b>	<b>63.3</b>	<b>60.5</b>	<b>49.7</b>	<b>48.4</b>
15 - 19	38.5	34.1	23.4	23.7
20 - 24	102.4	93.9	74.1	69.0
25 - 29	113.0	114.6	102.1	91.3
30 - 34	60.2	79.5	84.0	80.7
35 - 44	12.5	19.6	21.3	21.5

Slightly less than half of all births (49.0%) in 2001 were to women in their twenties (Table B-7), down from 56.1 percent in 1990. Women age 30 and over accounted for 42.3 percent of births, up from 35.4 percent in 1990. Women age 15 through 19 accounted for 8.2 percent of births, down from 8.5 percent in 1990.

### BIRTH WEIGHT

The median birth weight for all resident births in 2001 was 3,430 grams (7 pounds 9 ounces). Low birth weight infants are those born weighing less than 2,500 grams (5 pounds 8 ounces). They are much more likely than heavier babies to suffer short and long term disabilities, and to die in infancy. In 2001, 5.9 percent of Vermont resident births were low birth weight (Table B-16) and 1.1 percent were very low birth weight (less than 1,500 grams or 3 pounds 5 ounces). The U.S. white low birth weight rate for 2001 was 6.7 percent. The Vermont low birth weight and very low birth weight rates remain above the *Healthy Vermonters 2010* goals of 5.0 percent and 0.9 percent, respectively.

Low birth weight rates vary by age groups (Table B-16): in Vermont in 2001, the low birth weight rate among women under age 20 was 8.9 percent compared to 6.0 percent of births among women age 20-29 and 5.3 percent of births among women age 30 or older.

Infant birth weight is also positively associated with maternal weight gain: mothers who do not gain adequate weight during pregnancy are more likely to deliver low birth weight infants. On the other hand, there are risks associated with gaining too much weight including delivery complications, maternal and infant obesity. Although the weight gained by 17.6 percent of Vermont mothers in 2001 fell below the range recommended by the Institute of Medicine, 50.3 percent gained above the recommended range (Table B-31). Please refer to Appendix B for further information on the guidelines.

But the single most important preventable risk factor for low birth weight is smoking during pregnancy. The low birth weight rate among women who smoked cigarettes during their pregnancy was 8.6 percent compared to 5.2 percent among women who did not smoke during pregnancy (Table B-28). About one in five women reported smoking during their pregnancy in 2001, and among those who smoked before pregnancy or during the first trimester, 22.2 percent quit.

#### PRENATAL CARE

Early, comprehensive, and high quality prenatal care is essential for a healthy pregnancy and birth. Through prenatal care, pregnant women are screened for medical conditions and counseled on nutrition, behavioral risks (such as using tobacco and alcohol), and domestic violence.

In 2001, 89.5 percent of the babies were born to mothers who began prenatal care in the first three months of pregnancy (Table B-20). The *Healthy Vermonters 2010* goal for first trimester prenatal care is 90 percent. The percentage of women receiving first trimester prenatal care has been increasing, slowly but steadily since 1987. The percent of U.S. white births involving mothers who began prenatal care in the first trimester was 85.2 in 2001.

The proportion of births in 2001 to Vermont mothers who delayed care to the third trimester or received no prenatal care was 1.7 percent, slightly down from 2000. The proportion of women receiving late or no prenatal care in 2001 was 3.2 percent for U.S. white mothers. As in previous years, the age of the mother is closely associated with the time of entry to prenatal care with young women seeking care later than older women.

#### MEDICAL RISK FACTORS

Of the births in 2001, 69.3 percent of mothers had no reported medical risk factors for pregnancy (Table B-29). Of those with medical risk factors reported, the most common were pregnancy-associated hypertension, diabetes, anemia, previous pre-term or small-for-gestational-age infant, and acute or chronic lung disease. In 2001, 59.4 percent of births had no complications of labor and/or delivery reported. Of those with complications, the most common complications of labor and/or delivery were meconium, dysfunctional labor, fetal distress, premature rupture of membrane, and prolonged labor.

#### DELIVERIES

Of babies born in Vermont hospitals in 2001, 18.2 percent were delivered by cesarean section (Table B-27) compared to 24.3 percent for U.S. white women in 2001. The primary cesarean section rate was 13.2 percent in Vermont for 2001, compared to 16.7 percent for white mothers nationally in 2001. Of mothers delivering in Vermont hospitals in 2001 who had a previous delivery by cesarean section, 37.0 percent had vaginal births, compared to 16.2 percent for U.S. white mothers in 2001.

#### GESTATIONAL AGE

Please note that the methodology used to determine gestational age (Table B-15) was changed in 2001 to better match the methodology used by the National Center for Health Statistics. Please refer to Appendix B for a more detailed explanation.

# Deaths

Figure 9  
**VERMONT AND U.S. WHITE CRUDE DEATH RATES**  
 1955-2001

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. 2001 rate is preliminary.

## DEATHS

There were 5,202 resident deaths in 2001, 75 more than in 2000. The crude death rate increased slightly to 8.5 per 1,000 population. The death rate has fluctuated between 8.1 and 8.5 since 1988; prior to that it had been slowly declining for over two decades. The death rate was 11.2 in 1960, 10.0 in 1970, and 9.0 in 1980, 8.2 in 1990, and 8.4 in 2000. The Vermont crude death rate was slightly higher than the U.S. white crude death rate until 1970 when the rates converged and remained similar through 1980. Since 1981, Vermont's death rate has been slightly lower than the U.S. white rate. The preliminary 2001 U.S. white crude death rate was 9.0. Comparisons are made to the U.S. white rate because 99.6 percent of Vermont residents who died in 2001 were white (Table C-9).

For the past 40 years, the three leading causes of death in Vermont have been heart disease, cancer and stroke. Heart disease and cancer accounted for 51.5 percent of the deaths in 2001 (Table C-11). The heart disease crude death rate peaked in the 1960's at 439.5 deaths per 100,000 population. Since then, the rate has declined, and was 233.2 per 100,000 in 2001. The crude death rate from stroke (or cerebrovascular disease), the third leading cause, has also decreased significantly from a peak of 131.9 in the early 1960's to 52.8 in 2001 (Table C-1). These dramatic declines in heart disease and stroke are even more remarkable given that the average age of the population has increased. The crude death rates for cancer (or malignant neoplasms) have risen steadily over the past few decades from 167 in the period from 1969 to 1971 to 204.0 in 2001. This trend is in part a result of the aging population and the continued rise in crude death rates for lung cancer (44.7 in 1979-81, to 51.4 in 1994-96, to 56.5 in 2001).

Chronic lower respiratory disease (formerly referred to as chronic obstructive pulmonary disease) has been the fourth leading cause of death in Vermont since 1985. The crude death rate from this cause has increased from 33.0 in the period from 1979 to 1981 to 49.8 in 2001.

Accidents (or unintentional injuries) and diabetes were the fifth and sixth leading causes of deaths in Vermont in 2001, as they were in 2000. The crude death rate from accidents peaked at 58.4 in the period from 1969 to 1971 and declined to 31.3 in 1994 to 1996. In recent years, the death rate from accidents has increased, although the rate dropped slightly from 38.1 per 100,000 population in 2000 to 37.4 in 2001. Diabetes mortality has generally increased over the last 10 years, but the crude rate decreased a bit in 2001 to 25.5.

The crude death rate from Alzheimer's disease has steadily increased throughout the 90's and, after moving up from the tenth leading cause to the seventh in 1999 (listed incorrectly as eighth in last year's published report), it remained the seventh leading cause with a crude rate of 24.3 in 2001. Influenza and pneumonia remained the eighth (incorrectly listed as seventh in last year's report) leading cause, with a crude rate of 21.7 deaths per 100,000 in 2001.

The ninth and tenth leading causes of death in Vermont switched positions in 2001. Nephritis/nephrosis moved up from the tenth to the ninth leading cause with a rate of 14.0 in 2001. After increasing to 12.6 deaths per 100,000 population in 2000, the crude death rate for intentional self-harm (or suicide), decreased to 11.6 in 2001.

The leading causes of death varied with age (Tables C-2 and C-14). Unintentional injuries were the leading cause of death for people age 15 to 44. Cancer, followed by heart disease, were the leading causes of death among people ages 45 to 74. After age 75, heart disease was the leading cause of death, followed by cancer.

Death rates dramatically increase after age 75. People age 75 and over accounted for almost 61 percent of total deaths, but comprised only 5.8 percent of the total population. Except for accidents and influenza and pneumonia, the leading causes of death in this age group are all chronic diseases.

Deaths occurring in a hospital accounted for 42.6 of Vermont resident deaths (Table C-21) down from 62 percent in 1980 and 53 percent in 1990 but higher than 41.2 in 2000. In 2001, 22.5 percent of Vermont deaths occurred at home, and 26.4 percent occurred in a nursing home.

**Figure 10**  
**FIVE LEADING CAUSES OF DEATH**  
**2001 VERMONT AND U.S. WHITE**

Vermont death rates are age-adjusted to the 2000 U.S. white population. U.S. white rates are the 2000 crude death rates.

(a) CAUSE OF DEATH IS CODED BY THE INTERNATIONAL CLASSIFICATION OF DISEASES. DEATHS IN 1979 TO 1998 WERE CODED ACCORDING TO ICD-9. EFFECTIVE JANUARY 1, 1999 DEATHS WERE CODED ACCORDING TO ICD-10. SINCE SIGNIFICANT CHANGES WERE MADE IN ICD-10, THE CODE NUMBERS FOR ICD-9 AND ICD-10 ARE GIVEN IN ADDITION TO COMPARABILITY RATIOS WHICH HAVE BEEN APPLIED TO THE EARLIER RATES TO MAKE THEM COMPARABLE TO THE ICD-10 RATES.

(b) RATES PRESENTED HERE MAY DIFFER FROM THE 1999 VITAL STATISTICS REPORT BECAUSE THE COMPARABILITY RATIOS HAVE BEEN EXTENDED TO FOUR DECIMAL PLACES, AND THE 1991-1999 POPULATION ESTIMATES HAVE BEEN REVISED BASED ON THE 2000 CENSUS.

**INFANT AND NEONATAL MORTALITY RATES**  
**1955-2001**

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. rates for 2001 are preliminary.

Figure 11b  
**VERMONT & U.S. WHITE**  
**FETAL MORTALITY RATES**  
**1955-2001**

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. rates for 2000 and 2001 are not available.

## INFANT DEATHS, FETAL DEATHS, ABORTIONS AND PREGNANCIES

### INFANT DEATHS

In 2001, there were 35 resident infant deaths for a rate of 5.5 infant deaths per 1,000 live births. This is the lowest rate ever in Vermont (Table A-1). The rate remains above the *Healthy Vermonters 2010* goal of 4.5, but is lower than the preliminary 2001 U.S. white rate of 5.7. Comparisons are made to the U.S. white rate because all of the Vermont resident infant deaths were to whites in 2001. The Vermont infant mortality rate steadily declined from 24.0 in 1960 to 5.8 per 1,000 live births in 1991. The rate fluctuated through the rest of the 90's.

Twenty-three (65.7 percent) of the infant deaths occurred during the neonatal period, that is, before the infant became 28 days old (Table D-3). The neonatal death rate was 3.6 deaths per 1,000 live births (Table D-5), slightly lower than the preliminary 2001 U.S. white neonatal death rate of 3.8. The Vermont neonatal death rate has decreased over the past four decades from 18.6 in 1960, to 14.4 in 1970, to 6.2 in 1980, to 3.6 in 1990 (Table A-1). The rate increased through the nineties to a high of 5.9 in 1998 before dropping to the lowest rate ever in Vermont: 3.2 in 1999.

The leading causes of infant deaths (Table D-9) were prematurity and related causes (6), maternal complications (4), SIDS (3), and diseases of circulatory system (3).

One of the most important risk factors in infant mortality is low birth weight. Of resident infants who died in 2001, 58.8 percent had a birth weight less than 2500 grams (5 pounds 8 ounces), while 5.9 percent of all resident births were low weight. The infant mortality rate for low weight births was 53.1 deaths per 1,000 live births. Age of mother is also related to infant mortality (Table D-5). From 1999 to 2001, the infant mortality rate for mothers 15 through 19 years of age was 8.8, and for mothers age 20 through 24 the rate was 6.8. The youngest maternal age group also had the highest neonatal death rates at 6.3 for the 15-19 year olds.

### FETAL DEATHS

Unlike births and deaths, reports of fetal deaths and abortions are not shared among states. Therefore, statistics concerning these events reflect occurrences in Vermont only and do not include Vermont resident fetal deaths and abortions that occurred in other states.

There were 22 resident fetal deaths in 2001 (Table D-1) for a rate of 3.4 per 1,000 live births and fetal deaths, down from 4.9 per 1,000 live births and fetal deaths in 2000 (Table D-5). Of the fetal deaths in Vermont, 68.2 percent weighed less than 2500 grams (Table D-7). From 1999 to 2001, the fetal death rates were highest in the youngest and oldest age groups: 6.2 per 1,000 live births for women age 15 to 19, and 5.5 for women age 40 to 44 (Table D-5).

## VERMONT ABORTIONS

There were 1,513 abortions performed in Vermont in 2001; a number that has been decreasing since 1989 when 3,313 abortions were performed in Vermont. Vermont residents accounted for 1,297, or 85.7 percent. This represents a rate of 9.9 per 1,000 women age 15 to 44.

The abortion ratio is the number of resident abortions occurring in Vermont times 1,000, divided by the total resident live births. The abortion ratio for 2001 was 203.7 abortions per 1,000 live births, the lowest since 1975. The most recent U.S. white abortion ratio available was 188 per 1,000 live births, in 1998.

Women age 20 to 24 had the highest age-specific abortion rate, 25.1 per 1,000 women, followed by women age 25 to 29 at 15.2. First trimester abortions accounted for 94.4 percent of all Vermont abortions and 63.5 percent of all Vermont abortions were for pregnancies of less than 9 weeks duration. See Appendix B for the method used to compute the number of weeks of gestation.

*[Note: Thirty-nine abortion records reported last year in the 2000 Annual Vital Statistics Report were discovered to be duplicate records. The correct number of abortions performed in Vermont in 2000 was 1,742, rather than the reported 1,781.]*

## VERMONT RESIDENT PREGNANCIES

The pregnancy rate is derived by adding live births, fetal deaths and abortions. The pregnancy rates presented in this report underestimate the actual number of pregnancies for two reasons. First, Vermont resident abortions and fetal deaths that occur out of state are not reported to us. Second, by statute, fetal deaths prior to 20 weeks gestation are not reportable. Since residents of some counties may be more likely to use out-of-state services, the extent of these underestimates may differ among counties.

In 2001, the pregnancy rate in Vermont was 58.4 pregnancies per 1,000 women age 15 to 44 (Table F-1), compared to 61.2 in 2000, 77.1 in 1990, and 84.2 in 1980. The pregnancy rate peaked at 127.6 in 1960 and has dropped fairly steadily ever since (Table A-1).

The 2001 teen pregnancy rate was 36.4 pregnancies per 1,000 women age 15 to 19 years (Table F-1). This is down from 37.2 in 2000, and in general the teen pregnancy rate has been decreasing since 1991. In 2001, the highest pregnancy rate was seen in women 25 to 29 years of age at 104.9, followed by the 20 to 24 age group at 90.5. The lowest rate was for women age 35 to 44 at 25.0.

Figure 12  
**VERMONT AND U.S. WHITE ABORTION RATIOS**  
 1975-2001

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. ratios for 1999, 2000 and 2001 are unavailable. U.S. ratios are based on reporting states.

2001 TOTAL	3.4	6.4	3.6	5.5

**NOTES:**

*Fetal* and *perinatal* death rates are the number of resident fetal deaths and perinatal deaths per 1,000 resident live births and fetal deaths.

*Neonatal* and *infant* death rates are the number of resident neonatal and infant death rates per 1,000 resident live births.

Data for the years 1999-2001 have been combined to produce more stable rates.

# Marriages and Divorces

Figure 13  
**VERMONT AND U.S. MARRIAGE AND DIVORCE RATES**  
 1955-2001

Data points for the U.S. population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. rates can be found in Appendix D.

## MARRIAGES & DIVORCES

### MARRIAGES

In 2001, 5983 marriages were performed in Vermont, 288 less than in 2000. The VT rate was 9.8 per 1,000 population, the lowest rate in Vermont in more than 20 years, but higher than the 2001 U.S. provisional rate of 8.4. Marriages between two out-of-state residents accounted for 33.9 percent of the marriages in Vermont (Table G-2).

There was the usual seasonal variation with more marriages occurring in summer than in any other season. August was the most popular month for marriages in 2001 (Table G-7).

Half (50.6 percent) of the marriages were firsts for both bride and groom (Table G-5). Sixty-two percent were first marriages for the bride and 62 percent were first marriages for the groom. Remarriages for both bride and groom accounted for 26.3 percent of marriages in Vermont.

The percentage of civil ceremonies increased to 58.9 percent in 2001 (Table G-8). This percent has increased every year since 1990 when it was 47.2 percent.

### DIVORCES

There were 2,637 divorces granted in 2001, an increase of 111 from 2000. This represents a rate of 4.3 per 1,000 residents, slightly higher than the 2001 U.S. provisional rate of 4.0.

The median length of marriages ending in divorce was 9 years 2 months, with a range of 2 months to 51 years 10 months. Sixty percent of divorces followed a separation of a year or longer (Table H-3). The median age at the time of divorce was 38 for women with a range of 17 to 87 years. The median age at the time of divorce was 40 for men with a range of 19 to 89 years.

In 2001, 51.6 percent of divorces involved at least one child under the age of 18 (Table H-5), and a total of 2,360 children (Table H-7) were involved in a divorce. This represents 1.5 percent of all children residing in Vermont.

# Civil Unions and Dissolutions

## **CIVIL UNIONS**

In 2001, the first complete calendar year following the passage of the Vermont law allowing civil unions, 1,875 civil unions were established in Vermont. The highest number occurred in August (250).

Civil unions involving out-of-state residents accounted for almost 87 percent of the total number of civil unions (Table I-2), a nine percent increase from 2000. The states with the largest number of residents who established civil unions were New York, followed by Massachusetts and Florida (Table I-1). The largest number of Vermont residents who established civil unions resided in Chittenden County (Table I-2).

Sixty-seven percent of the civil unions were between female partners, and the most common age range for both male and female partners was 35 to 39 (Table I-4). Civil union partners of both sexes tend to be highly educated: 60 percent completed at least four years of college (Table I-5).

Table I-6 shows the total number of civil unions or marriages, including the current civil union, that each person has been a party to during their lives. For 76 percent of the civil union partners, this was their first union, or marriage.

## **DISSOLUTIONS**

The dissolution of civil unions follows the same procedures, same requirements, rights, and obligations as divorces. There were four dissolutions in 2001.

APPENDIX B  
OBSTETRIC DATES AND INTERVALS AND  
WEIGHT GAIN RECOMMENDATIONS

**MONTH PRENATAL CARE BEGAN**

In 1988, the Vermont Department of Health adopted the National Center for Health Statistics method of calculating the month prenatal care began. This allows Vermont data to be more easily compared to national data, and eliminates any errors that could be introduced by hospitals using different reporting methods.

The calculation is based on the month of last menses and the month of the first prenatal visit. For example, if the date of last menses was January 1 and the date of first prenatal visit was March 10, the calculation shows that prenatal care began in the second month.

**GESTATIONAL AGE**

Live Births and Fetal Deaths: The methodology used to determine gestational age was changed this year to better match the methodology used by the National Center for Health Statistics.

Two measures of gestational age are available from the standard certificates. The standard certificates collect information on the first day of the mother's last menstrual period (LMP). The interval between the LMP and the date of birth is the *calculated* gestational age. The standard certificate also collects a *clinical estimate* of gestation.

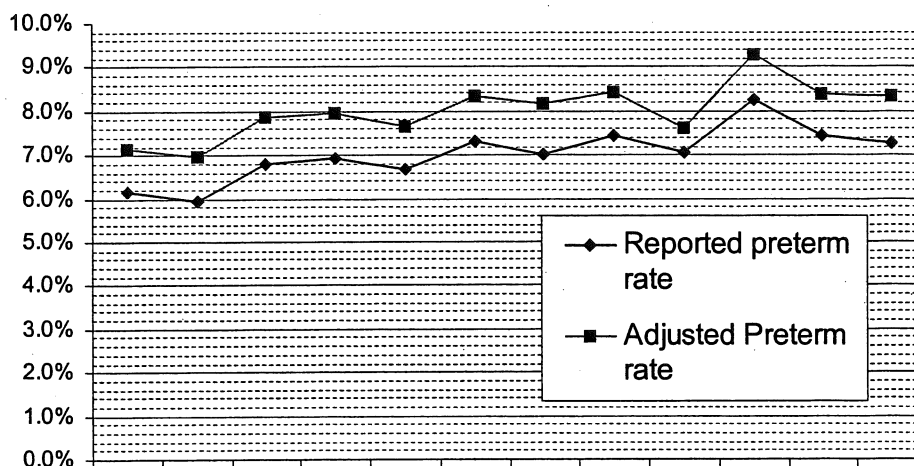

The primary measure used by NCHS to determine the gestational age of the newborn is the *calculated* weeks of gestation. However this method is subject to error due to imperfect maternal recall and to misidentification of the LMP. Therefore an edit is run that checks whether the calculated weeks of gestation is consistent with the infant's plurality and birth weight. If the birth weight is within the bounds for the calculated weeks of gestation, then the *calculated* weeks of gestation becomes the assigned gestational age. If the birth weight is not within the bounds for the calculated weeks, but it is within the bounds for the clinical estimate of gestation, then the *clinical estimate* of gestation is assigned as the gestational age. If the birth weight does not fit within the bounds for either the calculated weeks of gestation or the clinical estimate of gestation, the gestational age is designated "unknown". If the month and year for LMP are given, but the day is missing, the gestational age is *imputed* using the gestational age of the preceding record that has complete data with the same computed month of gestation and the same 500-gram birth weight interval.

Vermont's methodology was different in two respects. (1) The birth weight edit used in Vermont was more stringent than that used by NCHS. As a result approximately 2.5% fewer records each year used the calculated weeks gestation. For most of these records the clinical estimate was used. (2) The method used by NCHS to impute the gestational age could not be replicated in Vermont since the selection of the imputed value was dependent on the order of records in the file being used. In these cases in Vermont the clinical estimate was used as long as it met the birth weight edit.

An analysis was undertaken this past year to compare the results of these two slightly different methodologies. An unanticipated finding was that the Vermont method resulted in an approximately one percent lower rate of pre-term births (less than 37 weeks gestation). This difference has been consistent over the past 12 years. Over this period of time the pre-

term rate has been increasing both in Vermont and nationally. The pattern of increase is the same regardless of which method was used to determine weeks gestation. However the NCHS method results in an approximately one percent higher rate each year. (see graph below).

### Previously Reported and Adjusted Preterm Rates Vermont 1989-2000

	1989	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Reported preterm rate	6.1%	5.9%	6.8%	6.9%	6.6%	7.3%	7.0%	7.4%	7.0%	8.2%	7.4%	7.2%
Adjusted Preterm rate	7.1%	7.0%	7.8%	8.0%	7.7%	8.3%	8.2%	8.4%	7.6%	9.3%	8.4%	8.3%

This difference was due to NCHS's greater use of the calculated weeks gestation because of their broader birth weight ranges. The NCHS imputation did not affect the preterm rate. As a result of this finding Vermont has adopted the NCHS algorithm for checking weeks gestation against birth weight so that Vermont reports will be comparable to national data.

In 2001, 92.5 percent of the records used the *calculated* weeks, 7.2 percent used the *clinical estimate* of the weeks, and the remaining records were designated "*unknown*" gestational ages.

**Abortions:** Gestational age is calculated from the date of last normal menses and date of abortion. The clinically estimated weeks is used if the date of last normal menses is unknown, or if the calculated weeks and the clinically estimated weeks are more than two weeks apart.

#### NUMBER OF PRENATAL VISITS

Since 1985, hospitals report the date of the first and last recorded prenatal visits and the number of visits recorded. In 1986, a procedure was adopted for births of 36 or more weeks of gestation with less than 20 reported visits, and whose last reported visit was within four weeks of delivery. In these cases the Vermont Department of Health records the number of prenatal visits reported by the hospitals plus one visit for every week between the date of the last recorded visit and the delivery date.

## WEIGHT GAIN DURING PREGNANCY

The weight gain guidelines reflected in this report were taken from Nutrition During Pregnancy, Institute of Medicine, National Academy of Sciences, 1990. The recommendations are as follows:

PRE-PREGNANCY BMI	RECOMMENDED WEIGHT GAIN
< 19.8	28 - 40 lbs
19.8 - 26.0	25 - 35 lbs
26.1 - 29.0	15 - 25 lbs
> 29.0	7 - 15 lbs
Multiple births	35 - 45 lbs

1 1955-1975 rates based on race of child; 1980-1992 were previously reported by race of child, now reported by race of mother. Crude birth rates are per 1000 population. Fertility rates are per 1000 women aged 15-44.

2 Crude death rates are per 1000 population.

3 Rates are per 1000 live births. Fetal death rate is per 1000 live births plus fetal deaths.

4 Ratio is per 1000 live births.

5 Data are for all races. Rates are per 1000 population.

6 NCHS. "Revised Birth and Fertility Rates for the U.S., 2000 and 2001". National Vital Statistics Reports; Vol. 51, No. 4, February 6, 2003.

7 NCHS. "Births: Final Data for 2001". National Vital Statistics Reports; Vol. 51, No. 2, December 18, 2002.

8 NCHS. "Deaths: Preliminary Data for 2001". National Vital Statistics Reports; Vol. 51 No. 5, March 14, 2003.

9 Health, United States, 2002. Hyattsville, Maryland: National Center for Health Statistics, 2002. Fetal rates are per 1000 live births plus fetal deaths.

10 Health, United States, 2001. Hyattsville, Maryland: National Center for Health Statistics, 2001. Abortion ratio is per 1000 live births.

11 NCHS. "Births, Marriages, Divorces, and Deaths: Provisional Data for 2001". National Vital Statistics Reports; Vol. 50, No. 14, September 11, 2002.

**23a. MEDICAL RISK FACTORS FOR THIS PREGNANCY**  
(Check all that apply)

- Anemia (Hct. <30/Hgb. <10) ..... 01
- Cardiac disease ..... 02
- Acute or chronic lung disease ..... 03
- Diabetes ..... 04
- Genital herpes ..... 05
- Hydramnios/Oligohydramnios ..... 06
- Hemoglobinopathy ..... 07
- Hypertension, Chronic ..... 08
- Hypertension, pregnancy-associated ..... 09
- Eclampsia ..... 10
- Incompetent cervix ..... 11
- Previous infant 4000 + grams ..... 12
- Previous preterm or small-for-gestational-age infant ..... 13
- Renal disease ..... 14
- Rh sensitization ..... 15
- Uterine bleeding ..... 16
- None ..... 00
- Other ..... 17

(Specify) \_\_\_\_\_

**23b. OTHER RISK FACTORS FOR THIS PREGNANCY**  
(Complete all items)

Tobacco use during pregnancy ..... Yes  No   
Average number cigarettes per day \_\_\_\_\_

Alcohol use during pregnancy ..... Yes  No   
Average number drinks per week \_\_\_\_\_

Weight gained during pregnancy \_\_\_\_\_ lbs.

**24. METHOD OF DELIVERY (Check all that apply)**

- Vaginal ..... 01
- Vaginal birth after previous C-section ..... 02
- Primary C-section ..... 03
- Repeat C-section ..... 04
- Forceps ..... 05
- Vacuum ..... 06
- Hysterotomy/Hysterectomy ..... 07

**25. OBSTETRIC PROCEDURES**  
(Check all that apply)

- Amniocentesis ..... 01
- Electronic fetal monitoring ..... 02
- Induction of labor ..... 03
- Stimulation of labor ..... 04
- Tocolysis ..... 05
- Ultrasound ..... 06
- None ..... 00
- Other ..... 07

(Specify) \_\_\_\_\_

**26. COMPLICATIONS OF LABOR AND/OR DELIVERY**  
(Check all that apply)

- Febrile (>100° F. or 38° C.) ..... 01
- Meconium, moderate/heavy ..... 02
- Premature rupture of membrane (>12 hours) ..... 03
- Abruptio placenta ..... 04
- Placenta previa ..... 05
- Other excessive bleeding ..... 06
- Seizures during labor ..... 07
- Precipitous labor (<3 hours) ..... 08
- Prolonged labor (>20 hours) ..... 09
- Dysfunctional labor ..... 10
- Breech/Malpresentation ..... 11
- Cephalopelvic disproportion ..... 12
- Cord prolapse ..... 13
- Anesthetic complications ..... 14
- Fetal distress ..... 15
- None ..... 00
- Other ..... 16

(Specify) \_\_\_\_\_

**28. NAME OF PHYSICIAN PROVIDING PRENATAL CARE**

\_\_\_\_\_
