The Vermont Heat Vulnerability Index draws together 17 different measures of vulnerability in 6 different themes: population, socioeconomic, health, environmental, climate, and heat illness. These measures are combined to measure the overall vulnerability of Vermont towns to heat-related events. This is a first step to identify populations that may be more vulnerable to extreme heat, however local knowledge should always be considered when it is available.

**Heat Vulnerability Measures**

**Population Characteristics:**
1. % population less than 5 years old
2. % population 65 years old or older

**Socioeconomic Characteristics:**
3. % population living below Federal Poverty Line
4. % adult population with no high school diploma
5. % adults 65 and older living alone
6. % adult population with no health insurance

**Health Conditions:**
7. % adults with diabetes
8. % adults with asthma
9. % adults with hypertension
10. % adults who are obese
11. % adults in fair or poor health
12. All-cause mortality, warm season deaths

**Environmental Characteristics:**
13. Housing units per square mile
14. % covered with Impervious surface
15. % covered by forest canopy

**Climate Characteristics:**
16. Average number of days per year 87° F or hotter

**Observed Heat Illness:**
17. Heat-related emergency department visits
Heat Vulnerability Themes

Population
This theme indicates vulnerability based on the population composition of the town. Young children and older adults are age groups at higher risk for heat-related illnesses.

Environmental
This theme indicates vulnerability based on environmental characteristics. Summer heat is exacerbated in locations with dense housing, a high proportion of paved areas and rooftops, and few trees.

Acclimatization
This theme indicates vulnerability based on how acclimated residents are to hot summer temperatures. Those experiencing fewer hot days per year tend to be less adapted to the impacts of summer heat.

Socioeconomic
This theme indicates vulnerability based on social and economic resources available to town residents. Older adults living alone, those with less education, and those with fewer economic resources are often less able to find relief during summer heat.

Health
This theme indicates vulnerability based on the health status of town residents. Those with pre-existing medical conditions are more likely to suffer health impacts during summer heat events.

Heat Emergencies
This theme indicates vulnerability based on emergency department visits for heat illness in recent years. Towns that currently experience a high rate of heat-related emergencies are expected to continue experiencing a high rate in the near future.

Vulnerability Key:
(standard deviations)
- Less Vulnerable
- Population is less than 6 persons
- Vermont Counties
- More Vulnerable
- Lake Champlain
