

HPV Vaccination Rates Climb in Vermont

A recent CDC report shows that Vermont has made major gains in teen HPV vaccination coverage since last year. Vermont was among the states with the largest increases in HPV up-to-date status for adolescents 13-17 years. From 2016 to 2017, coverage for females and males combined rose from 55.7% to 64.5%. The findings are based on the 2017 National Immunization Survey-Teen and you can find the full report in the MMWR and review the data yourself on TeenVaxView.

Thank you for your work to protect Vermont teens from cancers caused by HPV!
