Influenza activity was categorized as **Sporadic** for MMWR Week 13

- Decreased levels of Influenza-like Illness (ILI)* activity seen in emergency departments
  - Of the total emergency room visits, 2% were due to ILI
- Decreased levels of ILI activity reported by outpatient providers
  - Sentinel providers reported 2% of patients had ILI
- Vermont Department of Health Laboratory reported **21 positive flu tests**
- National Respiratory and Enteric Virus Surveillance System reported **60 positive flu tests**
- No outbreaks reported

**VT Flu Geographic Spread**

- **No Activity**
- **Sporadic**
- **Local**
- **Regional**
- **Widespread**

**Based on CDC’s Activity Estimates Definitions:**
[www.cdc.gov/flu/weekly/overview.htm](http://www.cdc.gov/flu/weekly/overview.htm)

*ILI is defined as a measured fever of at least 100°F and cough or sore throat, without a known cause other than influenza.*
Syndromic Surveillance* of Influenza-Like Illness at Vermont Hospitals, 2018-2019 vs. Historic Data

% of Total Emergency Room Visits Due to ILI

Week ending 3/30/2019 (Week 13)

*Data pulled from ESSENCE (Electronic Surveillance System for the Early Notification of Community-based Epidemics)
Sentinel providers report the number of patients with ILI seen by their practice each week. There are 15 medical practices located throughout the state currently providing data.

Percent of Visits Reported by Vermont Sentinel Providers* with Influenza-like Illness by MMWR Week, 2016/17 – 2018/19 Flu Seasons

*The ILI data are more robust when a higher percentage of provider reports are received. Recent data are provisional due to reporting lags.
Percent of Visits Reported by Vermont Sentinel Providers* with Influenza-like Illness by Age Group by MMWR Week, 2016/17 – 2018/19 Flu Seasons

*The ILI data are more robust when a higher percentage of provider reports are received. Recent data are provisional due to reporting lags.
Percent of Visits Reported by Vermont Sentinel Providers* with Influenza-like Illness by Age Group by MMWR Week 2018/2019 Flu Season

*The ILI data are more robust when a higher percentage of provider reports are received. Recent data are provisional due to reporting lags.
LABORATORY DATA

Individual flu results are not reported to the Vermont Department of Health. The data below represents an unknown subset of the actual number of flu tests performed in Vermont.

Vermont Department of Health Laboratory (VDHL) tests specimens for flu to identify exactly which strains are currently causing illnesses in the state. Flu testing at the state laboratory is for surveillance purposes and is performed on specimens collected during an institutional outbreak and routinely by sentinel providers.

National Respiratory and Enteric Virus Surveillance System (NREVSS) data is collected from collaborating university and community hospital laboratories. These participating laboratories report positive results for a number of viruses, including influenza, on a weekly basis. Three Vermont hospitals voluntarily contribute data into this system.

*Laboratory data obtained from VDHL and NREVSS may include the same specimens tested for flu, they are not mutually exclusive. Facilities that report to NREVSS may submit a specimen to VDHL for additional testing, therefore being reported both in NREVSS and VDHL.

*Suspected outbreaks of ILI should be reported to the health department*

[MAP OF INFLUENZA SURVEILLANCE REGIONS IN VERMONT](http://healthvermont.gov/sites/default/files/documents/2016/11>ID_HS_sentinel_map_16.pdf)
Influenza activity decreased, but remains elevated in the United States. Influenza A(H1N1) predominated from October to mid-February and A(H3N2) viruses have been more commonly identified since late February. Small numbers of influenza B viruses have also been reported.

Full FluView report can be found here: https://www.cdc.gov/flu/weekly/index.htm
6 influenza-associated pediatric deaths were reported to CDC during week 13. So far this season, there have been 82 influenza-associated pediatric deaths reported to CDC. **There were no influenza-associated pediatric deaths reported in Vermont during week 13.** There has been 1 influenza-associated pediatric death in Vermont this season.
The proportion of outpatient visits for Influenza-like Illness for week 13 was 3.2% which is above the national baseline of 2.2%.
During week 13, the following ILI activity levels were experienced:

- Six states (Kentucky, Louisiana, Missouri, Rhode Island, South Carolina, and Virginia) experienced high ILI activity.
- New York City, the District of Columbia, Puerto Rico and 13 states (Arizona, California, Idaho, Illinois, Indiana, Maine, Mississippi, Nebraska, Nevada, New Jersey, Ohio, Oklahoma, and West Virginia) experienced low ILI activity.
- Data were insufficient to calculate an ILI activity level from the U.S. Virgin Islands.

Influenza-Like Illness (ILI) Activity Level Indicator Determined by Data Reported to ILINet
2018-19 Influenza Season Week 13 ending Mar 30, 2019

*This map uses the proportion of outpatient visits to health care providers for influenza-like illness to measure the ILI activity level within a state. It does not, however, measure the extent of geographic spread of flu within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels. Data collected in ILINet may disproportionally represent certain populations within a state, and therefore, may not accurately depict the full picture of influenza activity for the whole state.

Data displayed in this map are based on data collected in ILINet, whereas the State and Territorial flu activity map is based on reports from state and territorial epidemiologists. The data presented in this map is preliminary and may change as more data are received. Differences in the data presented here by CDC and independently by some state health departments likely represent differing levels of data completeness with data presented by the state likely being the more complete.

Full FluView report can be found here: https://www.cdc.gov/flu/weekly/index.htm
Geographic spread for week 13**:

**No activity** was not reported.

**Sporadic** activity was reported by the 1 state.

**Local** activity reported by D.C. and 1 state.

**Regional** activity was reported by 15 states.

**Widespread** activity was reported by Puerto Rico and 33 states.

---

*This map indicates geographic spread & does not measure the severity of influenza activity*
