Populations of Focus

The Vermont Department of Health (VDH) recognizes that some individuals are more likely to be affected by cancer than others due to social, environmental and economic disadvantages.

In developing the 2025 Vermont Cancer Plan, four populations of focus were chosen to track to assess disparities in health behaviors and outcomes. These four populations are highlighted in these data pages as well to support work focusing on decreasing disparities.

The four populations of focus are defined in the following ways, based on VDH’s main data sources:

- **Black, Indigenous and people of color (BIPOC):** Individuals who self-identified that they were of Hispanic, Latino/a, or Spanish origin, and/or responded that their race is one or more of the following: Black or African American, American Indian and/or Alaska Native, Asian, Pacific Islander.

- **Lesbian, gay, bisexual, transgender and queer (LGBTQ+) Vermonters:** Data sources only ask respondents to self-identify if they are lesbian, gay, bisexual and/or transgender. To best represent the available data therefore, we use LGBT when discussing findings from these data sources, while also acknowledging that these data do not fully represent the LGBTQ+ community.

- **Vermonters living with disabilities:** Individuals who self-identified as having one or more of the following conditions: sight impairment, being deaf or having serious difficulty hearing, difficulty walking, difficulty making decisions, difficulty doing errands alone, difficulty getting dressed alone.

- **Low-income Vermonters:** Individuals who have a household income that is 250% or less of the federal poverty limit.
Chapter 1: Risk Factors and Prevention

Published March 2022
Introduction: Risk Factors and Prevention

Cancer is a group of more than 100 different diseases that often develop gradually as the result of a complex mix of lifestyle, environmental, social and genetic factors.

People are at higher risk for certain cancers due both to factors related to personal behaviors such as: diet, physical inactivity, tobacco use, alcohol use, and overexposure to sunlight; and to social determinants of health such as race/ethnicity, income-level, disability status, and sexual identity and orientation.

This chapter of the Vermont Cancer Data Pages, Risk Factors and Prevention, explores the personal behaviors of Vermon ters that are known to increase or decrease the risk of developing cancer.

Note: Throughout this report, data comparisons presented as “higher,” “lower,” “larger,” “smaller,” “better,” “worse,” or as “significantly different” are all considered statistically significant differences. Statistical significance is assessed by comparing the confidence intervals of different groups.
Vermonters meet current physical activity guidelines more than the U.S. population.

Adults in Orleans County meet current physical activity guidelines less than Vermon ters in general.

HPV Vaccination, Ages 13-17

The rate of adolescents who have completed the HPV vaccine series varies widely across the state, with most counties falling under the statewide rate.

Having completed the HPV vaccine series requires adolescents who received the first dose before their 15th birthday to receive two doses, and those that received the first dose after their 15th birthday to receive 3 doses.
Chapter 2: Cancer Incidence

Published February 2023
Introduction: Cancer Incidence

Cancer is a group of more than 100 different diseases that often develop gradually as the result of a complex mix of lifestyle, environmental, social and genetic factors. This chapter of the Vermont Cancer Data Pages presents cancer incidence and staging data from the Vermont Cancer Registry (VCR).

A cancer incidence rate is the number of newly diagnosed cancers per 100,000 people. This chapter reports on the incidence rates of cancers associated with common risk behaviors such as tobacco use, alcohol use, diet, physical inactivity, underutilization of the HPV vaccine and overexposure to sunlight. For incidence rates of the most common cancers in Vermont, see the Vermont 2015-2019 Cancer Incidence and Mortality Report.

Rates in this chapter exclude basal cell and squamous cell skin cancers and in situ carcinomas except urinary bladder.

Cancer becomes more survivable when found and treated early, which can be accomplished through available cancer screening tests including those for lung, breast, cervical, and colorectal cancers. In general, the result of more widespread use of screening is lower advanced (regional/distant) stage incidence rates.

Note: Throughout this report, data comparisons presented as “higher,” “lower,” “larger,” “smaller,” “better,” “worse,” or as “significantly different” are all considered statistically significant differences. Statistical significance is assessed by comparing the confidence intervals of different groups.
Prostate and lung and bronchus cancers are the most common cancers among Vermont males.

- Prostate: 23%
- Lung and Bronchus: 14%
- Melanoma of the Skin: 9%
- Colon and Rectum: 8%
- Urinary Bladder: 8%
- All Other Sites: 39%

All estimates are age-adjusted to the 2000 U.S. standard population.
Breast and lung and bronchus cancers are the most common cancers among Vermont females.
Tobacco-Associated Cancers*

The incidence rate of tobacco-associated cancers in Vermont is similar to that of the U.S.

Definitions of Risk Factor-Associated Cancers

**Tobacco-Associated Cancers:** Lip, oral cavity, pharynx, esophagus, stomach, colon and rectum, liver, pancreas, larynx, trachea, lung, bronchus, cervix uteri, kidney and renal pelvis, urinary bladder, acute myeloid leukemia

**Ultraviolet-Associated Cancers:** Melanoma and non-melanoma skin cancers

**Obesity-Associated Cancers:** Esophageal adenocarcinoma, gastric cardia, colon and rectum, liver, gallbladder, pancreas, multiple myeloma, postmenopausal female breast, corpus and uterus not otherwise specified, ovary, kidney, meningioma, thyroid

**Physical Inactivity-Associated Cancers:** Colon, postmenopausal female breast, corpus and uterus not otherwise specified

**HPV-Associated Cancers:** Oropharyngeal squamous cell carcinoma, anal and rectal squamous cell carcinoma, vulvar squamous cell carcinoma, vaginal squamous cell carcinoma, cervical carcinoma, penile squamous cell carcinoma

**Alcohol-Associated Cancers:** Lip, oral cavity, pharynx, esophagus, colon and rectum, liver, larynx, female breast
Chapter 3: Cancer Screening

Published August 2022
Introduction: **Cancer Screening**

Screening provides an opportunity to find and treat cancers early, leading to a decrease in overall cancer mortality. Lung, cervical, breast, and colorectal cancers all have established screening guidelines, where the benefits of screening have been determined to outweigh any potential harms.

Screening data were analyzed using the following methods:

**Breast Cancer Screening**: Based on 2016 U.S. Preventative Services Task Force (USPSTF) recommendations. These calculations include women ages 50-74 years who had a mammogram in the past 2 years.

**Cervical Cancer Screening**: Based on 2018 USPSTF recommendations. These calculations include women who did not have a hysterectomy or were not pregnant, and who were either (1) ages 21-65 years and received a Pap test in the past 3 years or (2) ages 30-65 and received an HPV test within the past 5 years.

**Colorectal Cancer Screening**: Based on 2016 USPSTF recommendations. Because of limitations on the number of questions in the BRFSS survey, not all tests that are recommended for the detection of colorectal cancer are included here. The calculations used in this document include adults ages 50-75 who received (1) a fecal occult blood test or fecal immunochemical test within the past year, (2) a colonoscopy within the past 10 years or (3) a sigmoidoscopy within the past 5 years.

**Lung Cancer Screening**: Based on 2013 USPSTF recommendations. These calculations include adults ages 55-80 who have a smoking history of 30 pack-years or more and who currently smoke or have quit within the past 15 years.
Breast Cancer Screening

Vermonters meet breast cancer screening recommendations at a similar rate as the U.S. population.

The percent of adults who meet breast cancer screening recommendations in each county is like that of Vermont in general.

Vermont 77%  U.S. 79%

Chapter 4: Cancer Mortality
Published August 2022
Introduction: Cancer Mortality

Cancer mortality is the number of deaths from cancer occurring in a population during a year. Each year, more than 1,350 Vermonters die of cancer (Vermont Vital Statistics 2015-2019).

Five types of cancer make up the majority of new cancer diagnoses or cancer-related deaths. The sites in the body where these cancers occur are different for males and females. More commonly diagnosed cancers, such as melanoma, are not leading causes of cancer deaths because the chances of survival are higher. In contrast, certain cancers, such as pancreatic cancer, are less commonly diagnosed but much more likely to cause death.

Note: Throughout this report, data comparisons presented as “higher,” “lower,” “larger,” “smaller,” “better,” “worse,” or as “significantly different” are all considered statistically significant differences. Statistical significance is assessed by comparing the confidence intervals of different groups.
Cancer is a leading cause of death in Vermont.

Rates per 100,000 persons

- Malignant Neoplasms: 220.8
- Diseases of the Heart: 218.9
- Accidents: 64.4
- Chronic Lower Respiratory Disease: 54.6
- Alzheimer's Disease: 50.5
Vermont males and females have a lower liver cancer mortality rate than the U.S. population.

Rates per 100,000 persons

* indicates significant difference between groups

All rates are age-adjusted to the 2000 U.S. standard population
Vermont females have a **higher** mortality rate of lung and bronchus and colon and rectum cancers than U.S. females. Vermont females have a **lower** mortality rate of breast cancer. Rates per 100,000 persons

* indicates significant difference between groups

All rates are age-adjusted to the 2000 U.S. standard population
Vermont males have a higher mortality rate of esophagus cancer than U.S. males.

Rates per 100,000 persons

Lung cancer is the leading cause of cancer death for Vermont females.

Breast cancer is the second leading cause of cancer death for Vermont females.
Lung cancer is the leading cause of cancer death for Vermont males.

Prostate cancer is the second leading cause of cancer death for Vermont males.
Chapter 5: Cancer Survivorship

Published August 2022
Introduction: Cancer Survivorship

*Cancer prevalence* is the number or proportion of people alive today who have ever been diagnosed with cancer. This includes individuals who are newly diagnosed, in active treatment, have completed active treatment and those living with progressive symptoms of the disease. Prevalence is often compared to *incidence*, which is defined as the number or rate of new cancer diagnoses during a year.

A person who is diagnosed with cancer is most commonly called a *cancer survivor*, though this term is not universally accepted. Similarly, *survivorship* is the experience of those who have ever been diagnosed with cancer and describes the time from diagnosis to the end of the individual’s life.

Throughout this presentation, *cancer* refers to any type of cancer except skin cancer.
Cancer Prevalence

Vermonters have been diagnosed with cancer at the same rate as the US population.

Adults in Bennington county are more likely to have been diagnosed with cancer than Vermont adults in general.

*** Sample size too small to report.

Vermont Department of Health Source: BRFSS 2019

Cancer Survivorship

Vermont Department of Health Source: BRFSS 2018 and 2019
Cancer Prevalence in Vermont

BIPOC and White, Non-Hispanic adults have been diagnosed with cancer at a similar rate.

LGBT and non-LGBT adults have been diagnosed with cancer at a similar rate.

Adults with a disability have been diagnosed with cancer at a higher rate than those without a disability.

Adults with and without a low income have been diagnosed with cancer at the same rate.

Vermont Department of Health Source: BRFSS 2018 and 2019
The prevalence of cancer increases as age increases. **Vermonters ages 55+** have been diagnosed with cancer more than Vermonters in general.

Vermont Department of Health Source: BRFSS 2018, 2019
Females under the age of 65 are more likely to have been diagnosed with cancer than males of the same age.

Vermont Department of Health Source: BRFSS 2018, 2019

*Indicates significant difference between groups.
Cancer survivors report good or excellent health less and fair and poor health more than those without a cancer diagnosis.

Cancer survivors in all counties report good or excellent health at a similar rate as Vermont survivors.

*Indicates significant difference between groups.
General Health

BIPOC cancer survivors report good or excellent health less than White, Non-Hispanic survivors.

All estimates are age adjusted to the 2000 U.S. standard population
Data Sources

Behavioral Risk Factor Surveillance System (BRFSS): Vermont tracks risk behaviors using this telephone survey of adults. The results are used to plan, support, and evaluate health promotion and disease prevention programs. Vermont, along with the 49 other states and three territories, has participated in the BRFSS with the Centers for Disease Control and Prevention (CDC) since 1990. An adult (18 or older) in the household is asked a uniform set of questions. The results are weighted to represent the adult population of the state.

Youth Risk Behavior Survey (YRBS): Every two years since 1993, the Department of Health’s Division of Alcohol and Drug Abuse Program and the Department of Education’s Coordinated School Health Programs have sponsored the YRBS. The YRBS measures the prevalence of behaviors that contribute to the leading causes of death, disease, and injury among youth. The YRBS is part of a larger effort to help communities increase the “resiliency” of young people by reducing high risk behaviors and promoting healthy behaviors.

Vermont Immunization Registry (IMR): A confidential system for maintaining immunization records for all Vermont residents and those who seek medical care in Vermont. It was designed, developed, and is operated by the Vermont Department of Health, and was first made available to providers in July 2004. It receives immunization data from medical providers, hospitals, health insurers, and increasingly, from pharmacies and nursing homes. The advantage of using the IMR for immunization data is that unlike survey information, it is much more comprehensive, and is not subject to selection bias. As is the case with any large database, the IMR has its limitations. It can be very difficult to keep up with the residences of all these individuals, resulting in a larger population base in the registry than actually live in the state of Vermont. The data shown in this chapter represent vaccine completion rates as of April 2021.

Vermont Cancer Registry: The Vermont Cancer Registry (VCR) is Vermont’s statewide population-based cancer surveillance system. The registry collects information about all cancers (except non-melanoma skin cancers and carcinoma in situ of the cervix) and all benign brain tumors diagnosed in Vermont. All statistics exclude in situ carcinomas except urinary bladder, unless indicated otherwise. Vermont cases include Vermont residents only.

Vermont Vital Statistics: The Vermont Department of Health vital statistics system tracks the following vital events that occur in Vermont: births, deaths, marriages, divorces and dissolutions, fetal deaths, and abortions. The Department of Health also receives abstracts for Vermont resident births and deaths that occur in other states which allows the Department to do statistical analyses of vital events involving Vermont residents, including those events which occurred outside of the state. The Vermont and the U.S. mortality rates are based on the Vermont Vital Statistics System, Vermont Department of Health (1994-2019) and the SEER Program Mortality - Aggregated Total U.S. (1990-2019). Mortality data were coded using the International Classification of Disease Tenth Revision (ICD-10) coding system. Vermont deaths include Vermont residents only.
Data Notes

Age Adjustment: Many measures throughout this document are age adjusted. Age adjustment eliminates variation that results from differences in a populations’ age distributions. Measures from BRFSS are adjusted for age only if they are Healthy Vermonters 2020 goals. Age adjustment groupings come from those determined by Healthy People 2020.
