

University of Vermont Medical Center Nurse Staffing Data

2025 Nurse Staffing Data

Hospital Report Cards can be used to review and compare information about community and psychiatric hospitals in terms of quality of care (outcomes, patient satisfaction, and more), costs for common services, healthcare-associated infection ratios, nurse staffing levels, patient safety, and hospitals' financial information.

Data Notes

- Nurse staffing is measured by nursing care hours per patient day. Nursing care hours are the number of hours worked by nursing staff that have direct patient care responsibilities for more than 50% of their shift. Nursing Care Hours per Patient Day refers to the number of hours of nursing care provided on a hospital unit, compared to the number of patients on that unit during a 24-hour period. This measure was developed by the American Nurses Association for the National Database of Nursing Quality Indicators.
- There is no national standard for optimal nurse staffing level. This is due to varying factors like intensity of patient's needs, the number of admissions, discharges and transfers during a shift, level of experience of nursing staff, layout of the unit and availability of resources (ancillary staff, technology etc.).
