The Vermont Youth Risk Behavior Survey (YRBS) is part of a national school-based surveillance system conducted by the Centers for Disease Control and Prevention (CDC). The YRBS monitors health risk behaviors that contribute to the leading causes of death and disability among youth and young adults. These include:

- Behaviors that contribute to unintentional injuries and violence
- Sexual behaviors related to unintended pregnancy and sexually transmitted diseases (STDs), including HIV infection
- Alcohol and other drug use
- Tobacco use
- Unhealthy dietary behaviors
- Inadequate physical activity

The YRBS also measures other high priority health-related behaviors and protective factors. These include:

- Prevalence of obesity
- Attitudes and perceptions related to substance use
- Social determinants of health
- Youth assets
About the YRBS

In Vermont, the Department of Health works with the Agency of Education and the Centers for Disease Control and Prevention (CDC) to administer the YRBS. It is typically conducted every two years during the spring semester. The YRBS was first administered among students in 8th through 12th grades in 1993. Since 2011, Vermont has conducted two separate surveys: a high school survey of students in grades 9 through 12, and a middle school survey of students in grades 6 through 8.

The middle school and high school surveys differ slightly. The middle school survey is shorter and focuses more on lifetime behaviors and includes questions on fighting, bullying, suicidality, substance use, attitudes and perceptions about substance use, sexual activity, nutrition, physical activity, youth assets, and other factors related to health equity. The high school survey includes questions on these topics as well as more in-depth questions on current behaviors such as driving behaviors and self-reported height and weight.

Copies of the 2021 Vermont high school and middle school surveys as well as previous surveys can be found online at: www.healthvermont.gov/YRBS
About the YRBS

METHODOLOGY

The YRBS is a biannual school-based survey. In Vermont, students in all public schools and select independent schools across the state are invited to participate in the YRBS. Historically, this has always taken place in the Spring semester. However, due to the COVID-19 pandemic and remote learning, the CDC allowed for the survey to be delayed to the Fall semester later in 2021.

Survey procedures were designed to protect the privacy of students. The YRBS is confidential, anonymous, and optional for students. All students are read a standard set of directions and asked to complete the self-administered survey. Completion of the survey depends on a student’s ability to read and complete the questionnaire independently or with the use of computer assisted technology (e.g., screen readers). Thus, students with very limited reading skills or significant intellectual or learning disabilities, may not be adequately represented in this data. Students can decline participation at any time or skip any questions they do not wish to answer. In addition, to protect student's anonymity, data is suppressed when less than 50 students respond to a question or less than 5 students answer a question in a particular way.

In 2019, Vermont began administering a web-based version of the YRBS. Students complete the YRBS online using a unique, random login code to access the survey online. No survey logic or skip patterns are used to ensure that all student complete the survey in approximately the same time frame, regardless of how they answer a question.

For more information on the delayed administration and how it may have impacted the 2021 results, please see “Special Considerations in 2021” noted on the following pages.

Additional information about the methodology of the national, state, and large urban school district YRBSs has been described elsewhere and can be found online at: www.cdc.gov/healthyyouth/data/yrbs/methods.htm.
HOW ACCURATE ARE THE RESULTS?

Research indicates data of this nature may be gathered as credibly from adolescents as from adults. The anonymous survey design and survey environment encourages students to be honest and forthright.

Numerous precautions are taken to ensure the reliability and validity of the results. The CDC runs over 100 consistency checks on the data to exclude careless, invalid, or logically inconsistent answers. These internal reliability checks help identify the small percentage of students who falsify their answers.

The CDC also weights data, a mathematical procedure that makes data representative of the population from which it was drawn. Only states with an overall response rate of at least 60% are weighted based on gender, grade, and race/ethnicity. Since 1995, Vermont has obtained weighted data on the YRBS.

These precautions can reduce some sources of error, but not all.

For more information on survey reliability, read “Do students tell the truth?” Additional information about survey reliability is available [www.cdc.gov/healthyouth/data/yrbs](http://www.cdc.gov/healthyouth/data/yrbs). For more information on the delayed administration and how it may have impacted the Vermont 2021 results, please see “Special Considerations in 2021” noted on the following pages.
Using the YRBS Results

The YRBS is used to determine the prevalence of health behaviors. It can detect changes in risk behaviors over time and identify differences among subpopulations of students.

Data can be also be used to:

- Examine the co-occurrence of health behaviors;
- Compare national, state, and local data; and
- Obtain funding and monitor progress toward achieving program objectives and other indicators.

With this data, school and community organizations can focus prevention efforts and determine whether school policies and community programs are having the intended effect on student behaviors. Think of the YRBS as a tool for starting discussions, educating the community, and planning or evaluating programs.

For more information on the delayed administration and how it may have impacted the 2021 results, please see “Special Considerations in 2021” noted on the following pages.
Using the YRBS Results

**ENGAGING STUDENTS, SCHOOLS, AND COMMUNITIES**

- **Start the Conversation:** Use the YRBS to begin a conversation with teens about the personal choices they make or about the health of their community. Ask them if the results accurately reflect what they see happening around them. How do they explain the results? From their perspective, what is or is not working? How would they promote healthy behaviors?

- **Increase Awareness:** The YRBS provides an opportunity to break through “denial” and make community members aware of the risks that their young people face. It can also dispel myths and correct misinformation about the “average teenager.” The YRBS can highlight the positives and celebrate the fact that many students are abstaining from behaviors that endanger their health and their ability to succeed.

- **Plan and Evaluate Programs:** The YRBS can serve as the basis of a community needs assessment. It can help identify strengths and weaknesses in communities and can inform strategies to address those weaknesses.

- **Remember to Look at the Positive Side:** In most cases, the majority of adolescents are NOT engaging in risky behaviors. Although most of the charts examine the prevalence of risk behaviors, please remember the percentage of adolescents who are NOT engaging in these behaviors.

- **Participate in Getting to 'Y'** is an opportunity for students to take a lead in bringing meaning to their own Youth Risk Behavior Survey data and taking steps to strengthen their school and community based on their findings.

  - Schools and districts across the state form teams to analyze local level data, identify areas of strength and concern, and create a preliminary action plan. Through the Getting to ‘Y’ program, students attend a training day where they learn tools and strategies to examine data, explore root causes, and create next action steps. In addition, teams plan and host a community dialogue event to share their executive summary with the school and community. More information on upcoming trainings, newsletters, and resources visit: [Getting to ‘Y’](#).

*Getting to Y is a project of UP for Learning and is co-sponsored by the Vermont Department of Health*
UNDERSTANDING AND INTERPRETING THE RESULTS

The results in this report are weighted by gender, grade, and race/ethnicity in order to compensate for absenteeism and incomplete surveys. The weighting allows the results to be fully representative of middle school students in grades six through eight (middle school survey) and high school students grades nine through twelve (high school survey). Weighting permits us to draw inferences about the school-based student population in Vermont.

Throughout this report, statistically significant differences are noted. Statistical significance is calculated by comparing the 95% confidence intervals of two or more values. If the confidence intervals overlap, the percentages are not different. In other words, the two groups are not statistically different from one another. If the confidence intervals do not overlap, there is a statistical difference between the two groups.

A 95% confidence interval is a range of values and can vary due to the size of a particular population or how consistently students responded to an item. Sometimes, when comparing the responses of two or more groups, the overall percent may look very different, but the two numbers are not statistically different. Other times, the two values may be very close but differ statistically.

While this report notes statistical differences, we encourage you to consider meaningful differences: does the disparity merit a targeted intervention, show a real change in health, or otherwise mean something important to the community (statistics aside).
Special Considerations for 2021

There are no trend data in this report, and caution should be used when interpreting and comparing the 2021 results to other years.

The Vermont YRBS is typically administered during the spring semester of the school year. However, due to COVID-19 and related school closures, the CDC allowed for the 2021 YRBS to be delayed and administered during the fall semester. Students in Vermont took the survey between September and December 2021.

Prevalence estimates for the 2021 VT YRBS and comparisons with previous YRBS data have likely been impacted by some significant factors unique to 2021, including the COVID-19 pandemic and the delay of the survey. Students who participated in the 2021 YRBS were facing different educational and social experiences compared to those of previous participants. Disruptions, including remote learning, lack of social interactions and extracurricular activities, are likely reflected in the survey results.

Age can influence the risk behavior prevalence estimates. Because students took the survey in the fall semester (September-December 2021) instead of the spring semester (January-June 2021), the average age of survey participants was younger than in past years. As seen in other states with a fall 2021 YRBS administration, some risk behavior prevalence estimates may be lower due to the change in age of student participants. The following page shows the differences in age of students completing the YRBS between 2019 and 2021.

The 2023 YRBS survey will be administered during the spring semester as typically done.
Special Considerations for 2021

Age can influence risk behavior prevalence estimates. In 2021, more high school students were 14 years old or younger and fewer were 18 years or older compared to those in 2019. Similarly, more middle school students were 11 years old or younger and fewer were 14 years or older.

Interpreting the YRBS Results

This report contains bar charts and graphs to describe survey results for questions asked in the 2021 questionnaire. Each chart graphically describes the weighted prevalence rate (%) of students that reported each behavior.

Prevalence rates are reported by demographic subgroups including sex, grade, race/ethnicity, and sexual orientation/gender identity. Statistically significant differences by sex, grade and race/ethnicity are noted in the text, if they exist.

This report does not include trend data. For more information on the delayed administration and how it may have impacted the 2021 results, please see “Special Considerations in 2021.”

Example High School Chart
Interpreting the YRBS Results

DATA SUPPRESSION
For some questions, not enough students respond to be able to report an estimate. In those instances, “NA” is in place of a percentage indicating “too few students.” Reportable estimates include a numerator of at least 5 students and denominator of 50 or more students.

SUBGROUP COMPARISONS
Some subgroups have a higher prevalence of many health-risk behaviors that might place them at risk for unnecessary or premature mortality, morbidity and social problems.

While this report cannot depict all subgroups of students who experience disparities, this report does include differences among students by sex, race/ethnicity, grade in school, and sexual orientation/gender identity status. To draw as many statistically meaningful comparisons among groups as possible, some populations have been grouped together. Additional demographic “Populations in Focus” reports are available www.healthvermont.gov/yrbs.

In this report, all BIPOC students were grouped into a "BIPOC" category to compare to white, non-Hispanic students. Similarly, all lesbian, gay, bisexual, or other non-heterosexual sexual orientation and transgender students were grouped into a "LGBTQ+" category to compare to heterosexual/cisgender students.

We acknowledge that this grouping method strengthens statistical comparative power while also diminishing how precisely we can report the results among the distinct, diverse sub-populations within these groupings. Statistical differences are noted in the text. These are primarily noted throughout the report as one group being statistically more likely to report the behavior than another group.

KEY TERMS

M – Male
F – Female
Older students – 11th and 12th grades
Younger students – 9th and 10th grades
WnH – White and non-Hispanic
BIPOC – American Indian/Alaska Native, Asian, Black or African American, Native Hawaiian/Other Pacific Islander, or Hispanic /Latino
HetCis – Heterosexual and cisgender
LGBTQ+ – Transgender, lesbian, gay, bisexual, other sexual orientation, and questioning or unsure if they are transgender

Sample & Demographics
2021 Sample and Response Rate

This report presents the high school results from all public schools with students in grades nine through twelve, including independent and interstate schools, that serve as the public high school in their Supervisory Union. The results in this report are weighted by gender, grade, and race/ethnicity to compensate for absenteeism and incomplete surveys, as well as those few schools that chose not to participate.

Between September and December 2021, students at 59 high schools took the 2021 Vermont School Youth Risk Behavior Survey. Survey procedures protected students’ privacy by allowing for anonymous and voluntary participation and completion during a single class period. The survey included 110 questions.

After administration, the CDC cleans and edits the data file for inconsistencies. Missing data are not statistically imputed. Among the 17,708 completed questionnaires, 296 surveys failed quality control and were excluded from the final data set, resulting in 14,412 usable questionnaires.

**High School Response Rate†**

- **Schools** - 98% (59 of the 60 eligible schools)
- **Students** - 73% (17,412 of the 23,743 eligible students submitted usable questionnaires)
- **Overall response rate** - 98% * 73% = 72%

† Overall response rate is computed as (number of participating schools/number of eligible sampled schools) * (number of usable questionnaires / number of eligible students sampled in participating schools).

Personal Safety
Physical Violence & Bullying
During the past year, one in six students were in a physical fight.

- Male students are nearly two times more likely than female students to report being in a physical fight during the past year.
- 12th grade students are significantly less likely to have been in a physical fight during the past year. 9th grade students are significantly more likely to report physical fighting compared to older students in 11th and 12th grades.
- BIPOC students are significantly more likely than white, non-Hispanic students to report being in a physical fight during the past year.
- Physical fighting does not differ by sexual orientation and gender identity.

High School Students who Were in a Physical Fight, Past 12 Months
During the past 30 days, one in six students were bullied. About half of those (8%) experienced bullying on three or more days.

- Female students are significantly more likely than male students to experience bullying during the past 30 days.
- 9th grade students are significantly more likely to be bullied compared to their peers. 12th grade students are significantly less likely than others to experience bullying in the past 30 days.
- Experiencing bullying does not differ by race and ethnicity.
- LGBTQ+ students are twice as likely as heterosexual cisgender students to be bullied during the past month.

On the YRBS, bullying is defined as: one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way.

Electronic bullying is described as bullying through texting, Instagram, Facebook, or other social media sources.
Nearly one in ten students reported bullying someone during the past 30 days.

- Male students are significantly more likely than female students to bully others.
- Bullying others does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to bully others.
- Bullying others does not differ by sexual orientation/gender identity.

**NOTE**: On the YRBS, bullying is defined as when one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way.
Electronic Bullying

During the past 12 months, 17% of students were electronically bullied.

- Female students are significantly more likely than male students to experience electronic bullying.
- Younger students are significantly more likely to experience electronic bullying compared to students in 12th grade.
- Being electronically bullied does not differ by race and ethnicity.
- LGBTQ+ students are nearly twice as likely as heterosexual cisgender students to experience electronic bullying during the past year.

High School Students who Were Electronically Bullied, Past 12 Months

NOTE: On the YRBS, bullying is defined as when one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way.
During the past 30 days, 4% of students carried a weapon such as a gun, knife, or club on school property.

- Male students are significantly more likely than female students to carry a weapon on school property.
- Older students are significantly more likely than 9th grade students to carry a weapon on school property.
- BIPOC students are significantly more likely than white, non-Hispanic students to carry a weapon on school property.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to carry a weapon on school property.

High School Students who Carried a Weapon, Past 30 Days
Violence at School: Threatened with a Weapon

During the past year, 7% of students were threatened or injured with a weapon on school property.

- Being threatened with a weapon on school property does not differ by sex.
- Younger students are significantly more likely than 12th grade students to have been threatened with a weapon on school property.
- BIPOC students are significantly more likely than white, non-Hispanic students to have been threatened with a weapon on school property.
- LGBTQ+ students are significantly more than heterosexual cisgender students to have been threatened with a weapon on school property.

VERMONT DEPARTMENT OF HEALTH
Safety Concerns at School

During the past 30 days, 9% of students skipped school because they felt unsafe at school or on their way to or from school.

- Female students are significantly more likely than male students to skip school due to safety concerns at or on their way to or from school.
- Skipping school due to safety concerns does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to skip school due to safety concerns at or on their way to or from school.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to skip school due to safety concerns at or on their way to or from school.

High School Students who Felt Unsafe at or on Their Way to School, Past 30 Days
Overall, 21% of students have ever had someone do sexual things to them that they did not want. This includes things such as kissing, touching, or sexual intercourse.

- Female students are nearly four times more likely than male students to have experienced unwanted sexual contact.
- Older students are significantly more likely than younger students to have experienced unwanted sexual contact. 10th grade students are also significantly more likely than 9th grade students to have ever experienced unwanted sexual contact.
- BIPOC students are significantly more likely than white, non-Hispanic students to have experienced unwanted sexual contact.
- LGBTQ+ students are nearly three times more likely than heterosexual cisgender students to have experienced unwanted sexual contact.

### High School Students who Ever Experienced Unwanted Sexual Contact
Among students who dated or went out with someone during the past year, nearly three in ten went out with someone who purposely tried to control them or hurt them emotionally. This was described as being told who you could and could not spend time with, being humiliated in front of others, or being threatened if you did not do what they wanted.

Among students who dated or went out with someone during the past year:

- Female students are significantly more likely than male students to have dated or gone out with someone who tried to control or hurt them emotionally.
- Being in an emotionally abusive relationship does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to have dated or gone out with someone who tried to control or hurt them emotionally.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have dated or gone out with someone who tried to control or hurt them emotionally.

Intimate Relationship Physical Violence

Among students who dated during the past year, less than one in ten went out with someone who physically hurt them on purpose.

Among students who dated or went out with someone during the past year:
- Female students are significantly more likely than male students to have dated or gone out with someone who physically hurt them.
- 9th grade students are significantly less likely than 10th and 12th grade students to experience physical dating violence.
- BIPOC students are significantly more likely than white, non-Hispanic students to have dated or gone out with someone who physically hurt them.
- LGBTQ+ students are more than two times as likely as heterosexual cisgender students to have dated or gone out with someone who physically hurt them.

High School Students who Dated or Went Out With Someone and Experienced Physical Dating Violence, Past 12 Months
Two-thirds of students (67%) drove a car or other vehicle during the past 30 days. Among those who drive, a third reported texting or emailing while driving at least once during the past 30 days, 7% did so every day.

- Female students are significantly more likely than male students to text or email while driving a car or other vehicle.
- White non-Hispanic students are significantly more likely than BIPOC students to text or email while driving a car or other vehicle.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to text or email while driving a car or other vehicle.

Impaired Driving: Alcohol

Two-thirds of students (67%) drove a car or other vehicle during the past 30 days. Among students who drove a car or other vehicle during the past 30 days, 6% drove under the influence of alcohol.

- Male students are significantly more likely than female students to drive after drinking alcohol.
- BIPOC students are significantly more likely than white, non-Hispanic students to drive after drinking alcohol.
- Driving after drinking alcohol does not differ by sexual orientation and gender identity.

High School Students who Drive and Drove Under the Influence of Alcohol, Past 30 Days
Impaired Driving: Marijuana

Two-thirds of students (67%) drove a car or other vehicle during the past 30 days.

Among students who drove a car or other vehicle during the past 30 days one in ten drove under the influence of marijuana; 7% drove under the influence more than one time during the past 30 days.

- Male students are significantly more likely than female students to drive after they used marijuana.
- BIPOC students are significantly more likely than white, non-Hispanic students to drive after using marijuana.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to drive after using marijuana.

High School Students who Drive and Drove Under the Influence of Marijuana, Past 30 Days
During the past 30 days, 16% of students rode with a driver who had been drinking alcohol.

- Female students are significantly more likely to ride with someone who was drinking alcohol compared to male students.
- Older students are significantly more likely than 9th grade students to ride with someone who had been drinking alcohol.
- Riding with someone who had been drinking alcohol does not differ by race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to ride with someone who had been drinking alcohol.

**High School Students who Rode With a Driver who Had Been Drinking Alcohol, Past 30 Days**
During the past 30 days, nearly two in ten (19%) students rode with a driver who had used marijuana.

- Female students are significantly more likely than male students to ride with someone who had used marijuana.
- Older students are significantly more likely than younger students to ride with someone who had been using marijuana. 10th grade students are also significantly more likely than 9th grade students to ride with someone who was using marijuana.
- BIPOC students are significantly more likely than white, non-Hispanic students to ride with someone who was using marijuana.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to ride with someone who had been using marijuana.
Injuries & Prevention
During the past year, 73% of students rode a bicycle.

Most students who rode a bicycle in the past year, always wore a helmet or did so at least most of the time; 45% never or rarely wore a helmet.

- Among those who rode a bicycle, the following are significantly more likely to never or rarely wear a helmet
  - Male students
  - BIPOC students, and
  - Heterosexual cisgender students.
- 9th grade students are significantly less likely than their peers to never or rarely wear a helmet when riding a bicycle.
Concussion

Concussions are defined as “when a blow or jolt to the head causes problems such as headaches, dizziness, being dazed or confused, difficulty remembering or concentrating, vomiting, blurred vision, or being knocked out.”

During the past year, more than one in seven students experienced symptoms of a concussion from playing a sport or being physically active; 6% experienced more than one concussion.

- Male students are significantly more likely than female students to experience a concussion from being physically active during the past year.
- Experiencing a concussion from physical activity or playing a sport does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to experience a concussion from being physically active or playing a sport.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to experience a concussion from being physically active or playing a sport.

A third of students reported that they have been bothered by feeling nervous, anxious, or on edge always or most of the time during the past year.

- Female students are significantly more likely than male students to feel nervous, anxious, or on edge at least most of the time during the past year.
- 9th grade students are significantly less likely than older students to feel nervous, anxious, or on edge at least most of the time during the past year. 10th grade students are also significantly less likely than 11th grade students feel nervous, anxious, or on edge.
- Feeling nervous, anxious, or on edge at least most of the time during the past year does not differ by race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to feel nervous, anxious, or on edge at least most of the time during the past year.

High School Students who Were Always or Most of the Time Nervous, Anxious, or on Edge, Past 12 Months
Self-Harm

One in five students reported hurting themselves without wanting to die, such as by cutting or burning on purpose, in the past 12 months.

- Female students are more than two times as likely as male students to have hurt themselves on purpose during the past year.
- 12th grade students are significantly less likely to have hurt themselves on purpose during the past year compared to students in 9th, 10th and 11th grade.
- BIPOC students are significantly more likely than white, non-Hispanic students to have hurt themselves on purpose during the past year.
- LGBTQ+ students are 3.5 times as likely as heterosexual cisgender students to have hurt themselves on purpose during the past year.

High School Students who Purposely Hurt Oneself Without Wanting to Die, Past 12 Months
About one in seven students made a plan about how they would attempt suicide during the past 12 months.

- Female students are two times more likely than male students to have made a suicide plan during the past year.
- Making a suicide plan does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to have made a suicide plan during the past year.
- LGBTQ+ students are more than 3.5 times as likely as heterosexual cisgender students to have made a suicide plan during the past year.
During the past 12 months, 7% of students attempted suicide.

- Female students are significantly more likely than male students to have attempted suicide during the past year.
- 12th grade students are significantly less likely to have attempted suicide during the past year compared to students in 9th, 10th and 11th grade.
- BIPOC students are nearly two times as likely white, non-Hispanic students to have attempted suicide during the past year.
- LGBTQ+ students are 3.5 times as likely as heterosexual cisgender students to have attempted suicide during the past year.

High School Students who Attempted Suicide, Past 12 Months
Substance Use
Lifetime Substance Use
Less than one in five students have ever tried smoking a cigarette, even one or two puffs.

- Ever trying a cigarette does not differ by sex.
- Prevalence of ever trying a cigarette significantly increases with each grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to have ever tried a cigarette.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have ever tried a cigarette.
One-third of high school students have ever tried an electronic vapor product (EVP).

- Female students are significantly more likely than male students to have ever tried an EVP.
- Prevalence of ever trying an EVP significantly increases with each grade level.
- Prevalence of ever trying an EVP does not differ by race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to ever try an EVP.

### Lifetime Use of Electronic Vapor Products (EVP)

Electronic vapor products (EVP) are defined as e-cigarettes, vapes, vape pens, e-cigars, e-hookahs, hookah pens, and mods. Common products include: JUUL, SMOK, Suorin, Vuse, and blu.
Less than one in five students have ever tried a tobacco product flavored to taste like menthol (mint), clove, spice, alcohol (wine or cognac), candy, fruit, chocolate, or other sweets.

- Female students are significantly more likely than male students to have ever tried a flavored tobacco product.
- Prevalence of ever trying a flavored tobacco product significantly increases with each grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to have ever tried a flavored tobacco product.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have ever tried a flavored tobacco product.

About one in 15 students have tried marijuana, cigarettes, or flavored tobacco products before they were 13 years old. One in eight tried alcohol before age 13.
Lifetime Prescription Drug Misuse

Prescription drug misuse includes using a medicine that was not prescribed to you or using it differently than how a doctor told you to use it.

One in ten high school students have ever used a prescription stimulant or pain reliever that was not prescribed to them or used one in a manner different from how it was prescribed.

- Female students are significantly more likely than male students to ever misuse a prescription drug.
- Ever misusing a prescription pain reliever or stimulant does not differ by grade level.
- BIPOC students are significantly more likely to ever misuse a prescription pain reliever or stimulant compared to white, non-Hispanic students.
- LGBTQ+ students are nearly two times as likely as heterosexual cisgender students to ever misuse a prescription pain reliever or stimulant.

High School Students who Ever Misused a Prescription Pain Reliever or Stimulant

Prescription drug misuse includes misuse of prescription pain medicine or stimulants such as Vicodin, OxyContin, Hydrocodone, Percocet, Adderall, or Ritalin.
Overall, 8% of students reported ever taking prescription pain medicine not prescribed to them or taking it differently than their doctor prescribed.

- Female students are significantly more likely than male students to have misused a prescription pain reliever.
- Lifetime misuse of prescription pain relievers does not differ by grade level.
- BIPOC students are significantly more likely to have ever misused a prescription pain reliever compared to white, non-Hispanic students.
- LGBTQ+ students are twice as likely as heterosexual cisgender students to misuse a prescription pain reliever during their lifetime.

- 11 to 20 cigarettes: 2%
- More than 20 cigarettes: 13%
Among Cigarette Users

FREQUENCY: 20 DAYS OR MORE

Among current smokers, a quarter smoked on 20 or more days; 21% smoked daily.

Among current smokers:

- Smoking cigarettes on 20 or more days does not differ by sex, grade level and sexual orientation and gender identity.
- BIPOC students are significantly more likely than white, non-Hispanic students to smoke on 20 or more days.

High School Students who Smoked Cigarettes and Smoked Cigarettes on 20 or More Days, Past 30 Days
Among current smokers, one in seven smoked 11 or more cigarettes or more than half a pack, on days they smoked.

Among current smokers:
- Male students are significantly more likely than female students to smoke 11 or more cigarettes on days smoked.
- The number of cigarettes smoked does not differ by grade level or sexual orientation and gender identity.
- BIPOC students are significantly more likely than white, non-Hispanic students to smoke 11 or more cigarettes per day.
During the last 30 days, 16% of students reported using electronic vapor products (EVP).

**Electronic vapor products (EVP) are defined as e-cigarettes, vapes, vape pens, e-cigars, e-hookahs, hookah pens, and mods. Common products include: JUUL, SMOK, Suorin, Vuse, and blu.**

- Female students are significantly more likely to use an EVP during the past 30 days compared to male students.
- Current EVP use significantly increases with each grade level.
- Current EVP use does not differ by race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to use an EVP during the past 30 days.
Among students who currently used electronic vapor products (EVP), three in ten students used them every day, about a third (33%) used them on 5 or fewer days in the past month.
Among students who used EVP during the past 30 days, 42% used it on 20 or more days.

- Among students that used EVP during the past 30 days, there were no significant differences by sex, race and ethnicity, or sexual orientation and gender identity.
- 12th grade students are significantly more likely than younger students to use an EVP on 20 or more days in the past month.
Among Electronic Vapor Product Users

PRIMARY REASON FOR USING

Among students who used EVP during the past 30 days, about three in ten students used an electronic vapor product (EVP) because they wanted to get high or a buzz or were feeling anxious or stressed. About one in eight used them because they were curious; 11% used them for some other reason.

* In 2021, response options around primarily reasons for using EVP changed.
Among current electronic vapor product (EVP) users, nearly two-thirds primarily got an EVP from a friend or family member.

About one in eight current EVP users bought or took them from a store or got them online.
Among students who used electronic vapor products during the past 30 days, nearly half used a disposable electronic cigarette or non-rechargeable vaping device. Two in ten used a JUUL or similar device with a rechargeable pod.

Nearly one in ten current EVP users were not sure the type of device they used.

Type of Electronic Vapor Product Used Among High School Students who Used an EVP, Past 30 Days

- Disposable electronic cigarette / vaping device: 48%
- JUUL / rechargeable pods: 19%
- Vape pen / rechargeable electronic cigarette: 11%
- Not sure: 9%
- Other electronic vapor product: 7%
- Mods with refillable tank: 5%
Cigar, Cigarillos, and Little Cigars

Less than 1 in 20 high school students smoked cigars, cigarillos, or little cigars during the past 30 days.

- Male students are significantly more likely than female students to smoke cigars.
- 12th grade students are significantly more likely to smoke cigars compared to their peers; 9th grade students are significantly less likely than other students to currently smoke cigars.
- BIPOC students are significantly more likely than white, non-Hispanic students to use cigars.
- Current cigar use does not differ by sexual orientation and gender identity.

High School Students who Used Cigars, Past 30 Days
Smokeless Tobacco

Smokeless tobacco product use includes chewing tobacco, snuff, dip, snus, or dissolvable tobacco products, such as Copenhagen, Grizzly, Skoal, or Camel Snus.

Less than one in 20 high school students used chewing tobacco, snuff, dip, snus, or dissolvable tobacco products during the past 30 days.

- Male students are significantly more likely than female students to use smokeless tobacco.
- Older students are significantly more likely than younger students to use smokeless tobacco. 10th grade students are also significantly more likely than 9th grade students to currently use smokeless tobacco.
- BIPOC students are significantly more likely than white, non-Hispanic students to use smokeless tobacco products.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to currently use smokeless tobacco products.

High School Students who Used Smokeless Tobacco, Past 30 Days
Among students who used tobacco products during the past year, about half tried to quit using all tobacco products.

Among students who used tobacco products during the past year:
- Female students are significantly more likely than male students to try to quit using all tobacco products during the past year.
- Attempting to quit using all tobacco products during the past year does not differ by grade, race and ethnicity, or sexual orientation and gender identity.

### High School Students who Used Tobacco Products During Past Year and Tried to Quit Using All Tobacco Products, Past Year

Binge Drinking

Binge drinking is defined for males as consuming five or more drinks and when females as consuming four or more drinks in one sitting.

During the past 30 days, 1 in 8 students binge drank; 3% drank ten or more drinks in a row.

- Female students are significantly more likely to report binge drinking during the past 30 days compared to male students. However, male students are significantly more likely to report drinking ten or more drinks in a row (data not shown: 4% vs 1%)
- Binge drinking significantly increases with each grade level.
- Binge drinking during the past 30 days does not differ by race and ethnicity, or sexual orientation and gender identity.

High School Students who Binge Drank, Past 30 Days
Among Current Drinkers

FREQUENCY OF USE

Among students who reported drinking during the past 30 days, about half drank on one or two days; 13% drank on ten or more days.

LARGEST QUANTITY DRANK IN ONE SITTING

Among students who reported drinking during the past 30 days, about a third had one or two drinks in a row, within a couple of hours; about a third (36%) consumed 6 or more drinks in a row.

† Binge drinking occurs when males consume five or more drinks or females consume four or more drinks in a row.
Among Current Drinkers

LARGEST AMOUNT CONSUMED IN ONE SITTING

Among students who drank during the past 30 days, one in eight consumed more than ten drinks in a row. Among students who currently drink alcohol,

- Male students are significantly more likely than female students to have ten or more drinks in a row, within a couple of hours in the past month.
- Drinking ten or more drinks in a row does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to have ten or more drinks in a row.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to have ten or more drinks in a row, within a couple of hours in the past month.

High School Students who Drank Alcohol and Had Ten or More Drinks in a Row
Current Marijuana Use

One in five high school students used marijuana during the past 30 days.

- Female students are significantly more likely than male students to currently use marijuana.
- Current marijuana use increases with each grade level.
- Current marijuana use does not differ by race or ethnicity.
- LGBTQ+ students are significantly more likely to use marijuana during the past 30 days compared to heterosexual cisgender students.

High School Students who Used Marijuana, Past 30 Days
Among Marijuana Users

FREQUENCY OF USE
Among current marijuana users, about a third used it one to two times. Three in ten used it 20 or more times in the past month; 42% used it ten or more times.

Primary Methods Used to Consume Marijuana, Past 30 Days
Among High School Students who Used Marijuana

- Smoked it: 76%
- Vaped it: 10%
- Ate or Drank it: 9%
- Dabbed it: 4%
- Some other way: 2%
Among current marijuana users, more than four in ten students used marijuana ten or more times in the past 30 days.

Among students who used marijuana in the past month:
- Male students are significantly more likely than females to use marijuana ten or more times in the past month.
- Using marijuana ten or more times does not differ by grade level or sexual orientation and gender identity.
- BIPOC students are significantly more likely than white, non-Hispanic students to use marijuana ten or more times in the past month.
Among Marijuana Users

PRIMARILY VAPE MET MARIJUANA

One in ten students who used marijuana in the past 30 days, primarily vaped it.

- Among students who currently use marijuana, primarily vaping it does not differ by sex, grade level, race and ethnicity, or sexual orientation and gender identity.

High School Students who Used Marijuana and Primarily Vaped Marijuana
Current Prescription Drug Misuse

- Misusing a prescription drug during the past 30 days does not differ by sex.
- 12th grade students are significantly more likely than 9th grade students to misuse a prescription drug during the past 30 days.
- BIPOC students are significantly more likely than white, non-Hispanic students to misuse prescription drugs during the past 30 days.
- LGBTQ+ students are significantly more likely to misuse prescription drugs compared to heterosexual cisgender students.

Prescription drug use includes using any prescription medicine such as codeine, Vicodin, OxyContin, Hydrocodone, Percocet, Adderall, or Ritalin without a doctor’s prescription or in a different manner than prescribed.

Overall, 2% of students misused a prescription during the past 30 days.

Substance Use
Screenings & Exposure on School Property
Among all high school students, 15% of students did not talk to doctor, dentist, or nurse during the past year.

Among those who saw a provider, about half were asked if they smoked by a doctor, dentist, or nurse. Nearly one in five (19%) were not sure if their medical provider asked them about smoking.

- Female students are significantly more likely than male students to be asked by a doctor, nurse, or dentist about smoking.
- Older students are significantly more likely to be asked about smoking by a doctor, nurse, or dentist compared to younger students. 10th grade students are also significantly more likely than 9th grade students to be asked about smoking.
- Being asked about smoking by a medical provider does not differ by race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to be asked about smoking by a doctor, nurse, or dentist.

Attitudes & Perceptions about Substance Use
Peer Disapproval

- Male students are significantly more likely than female students to believe it is wrong or very wrong for someone their age to use alcohol, marijuana, or EVP.

- Believing it is wrong or very wrong for someone their age to use alcohol, marijuana, or EVP significantly decreases with each grade level.

- BIPOC students are significantly more likely than white, non-Hispanic students to believe it is wrong or very wrong for someone their age to use alcohol.

- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to believe it is wrong or very wrong for someone their age to use EVP or marijuana.

High School Students who Believe it is Wrong or Very Wrong for Someone Their Age to Use

- **Alcohol**
  - 2021: M = 55%, F = 59%, 9th = 73%, 10th = 59%, 11th = 48%, 12th = 40%
  - WnH = 54%, BiPOC = 61%, HetCis = 55%, LGBTQ = 55%

- **Marijuana**
  - 2021: M = 55%, F = 57%, 9th = 73%, 10th = 59%, 11th = 48%, 12th = 40%
  - WnH = 55%, BiPOC = 56%, HetCis = 59%, LGBTQ = 45%

- **EVP**
  - 2021: M = 67%, F = 69%, 9th = 76%, 10th = 70%, 11th = 64%, 12th = 58%
  - WnH = 67%, BiPOC = 66%, HetCis = 69%, LGBTQ = 63%
Parental Disapproval

- Female students are significantly more likely to believe their parents would think it is wrong or very wrong for them to use EVP.

- With each increasing grade level, students are significantly less likely to believe their parents would think it is wrong or very wrong for them to use alcohol or marijuana. Older students are less likely to believe their parents would think it is wrong or very wrong for them to use EVP, with significant differences between 9th and 11th grade and 11th and 12th grade.

- BIPOC students are significantly more likely to believe their parents would think it is wrong or very wrong for them to use alcohol, but significantly less likely to believe their parents would think it is wrong or very wrong for them to use EVP compared to white, non-Hispanic students.

- Heterosexual cisgender students are significantly more likely to believe their parents would think it is wrong or very wrong for them to use marijuana or EVP compared to LGBTQ+ students.
Perceived Risk of Harm

The majority of students believe people have a great or moderate risk of themselves, physically or in other ways, if they binge drink each weekend, use marijuana regularly, or use EVP regularly.
Perceived Risk of Harm

- Female students are significantly more likely than male students to believe binge drinking, using marijuana, and using EVP regularly would cause great risk of harm.

- Perceived risk of harm from marijuana use significantly decreases with each grade level. 12th grade students are significantly less likely than younger students to think binge drinking causes great harm. 9th grade students are significantly more likely than 12th grade students to believe EVP use causes great risk of harm.

- BIPOC students are significantly more likely to believe binge drinking, and using marijuana regularly would cause great risk of harm.

- LGBTQ+ students are significantly more likely than heterosexual cisgender students to think binge drinking and using EVP regularly would cause great risk of harm. Heterosexual cisgender students are significantly more likely than LGBTQ+ students to believe using marijuana regularly would cause great risk of harm.
Perceived Availability

Most students believe it would be sort of or very easy to get alcohol, marijuana, or EVPs if they wanted to get it.
Perceived Availability

- Female students are significantly more likely than male students to believe it would be easy or very easy to get alcohol or marijuana.
- With each increasing grade level, students are significantly more likely to believe it would be easy or very easy to get marijuana or EVP. Older students are significantly more likely than younger students to believe it would be easy or very easy to get alcohol. 10th grade students are also significantly more likely than 9th grade students to believe it would be easy or very easy to get alcohol.
- White, non-Hispanic students are significantly more likely than BIPOC students to think it would be easy or very easy to get alcohol, marijuana, or EVP if they wanted it.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to believe if they wanted it, it would be easy or very easy to get alcohol or marijuana.
HIV and STD Testing
Excluding testing done for blood donations, more than 1 in 16 high school students have ever been tested for human immunodeficiency virus (HIV).

- Ever being tested for HIV does not differ by sex.
- Ever being tested for HIV significantly increases with each grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to have ever been tested for HIV.
- LGBTQ+ students are significantly more likely to have ever been tested for HIV compared to heterosexual cisgender students.

* Sexually active students includes only students who reported having sexual intercourse during the past three months.
Among students who are currently sexually active, nearly half used a condom the last time they had sex.

Among students who had sexual intercourse during the past three months:
- Male students are significantly more likely than female students to use a condom the last time they had sexual intercourse.
- 9th grade students are significantly more likely than 12th grade students to use a condom the last time they had sexual intercourse.
- White, non-Hispanic students are significantly more likely than BIPOC students to use a condom the last time they had sexual intercourse.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to use a condom the last time they had sexual intercourse.

* Sexually active students includes only students who reported having sexual intercourse during the past three months.
Overall, more than half of sexually active students used prescription birth control such as oral pills, an IUD or implant, a shot, patch, or birth control ring to prevent pregnancy before they had sexual intercourse. Nearly a third used a condom to prevent pregnancy.

Primary Method Used to Prevent Pregnancy Among High School Students who Had Sexual Intercourse During the Past Three Months

- **IUD or Implant**: 18%
- **Shot, patch, ring**: 4%
- **Birth control pills**: 31%
- **Condom**: 31%
- **Withdrawal or some other method**: 5%
- **Not Sure**: 3%
- **No Method**: 7%

*Sexually active students includes only students who reported having sexual intercourse during the past three months.*
Pregnancy Prevention Among Sexually Active Students

Most effective forms of birth control include Long Acting, Reversible Contraceptives (LARC) such as implants (i.e. Implanon or Nexplanon) and intrauterine devices (IUD) (i.e. Mirena or ParaGard). Moderately effective forms of birth control include birth control pills, a shot (i.e. Depro-Provera), patch (i.e. Ortho Evra) or birth control ring (i.e. NuvaRing).

Just over half of sexually active students reported using a most or moderately effective contraception to prevent pregnancy the last time they had sexual intercourse.

Among students who had sexual intercourse during the past three months:
- Female students are significantly more likely than male students to report using a moderately or highly effective form of birth control to prevent pregnancy.
- Use of a moderately or highly effective form of birth control among sexually active students increases significantly with each grade level.
- White, non-Hispanic students are significantly more likely than BIPOC students to use a moderately or highly effective form of birth control.
- Use of moderate or most effective birth control does not differ by sexual orientation and gender identity.

High School Students who Had Sexual Intercourse During the Past Three Months and Used Moderate or Most Effective Birth Control to Prevent Pregnancy Before Last Sexual Intercourse

* Sexually active students includes only students who reported having sexual intercourse during the past three months.
More than one in five sexually active students, used both a condom and prescription birth control such as birth control pills; an IUD or implant; or a shot, patch, or birth control ring, before last sexual intercourse.

Among students who were currently sexually active,

- Female students are significantly more likely than male students to use both a condom and another form of birth control to prevent pregnancy the last time they had sexual intercourse.
- 9th grade students are significantly less likely than older students to use both a condom and prescription birth control the last time they had sexual intercourse.
- White, non-Hispanic students are significantly more likely than BIPOC students to use both a condom and prescription birth control the last time they had sexual intercourse.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to use both a condom and prescription birth control the last time they had sexual intercourse.

High School Students who Had Sexual Intercourse During the Past Three Months and Used Both a Condom and Moderate or Most Effective Birth Control to Prevent Pregnancy Before Last Sexual Intercourse

* Sexually active students includes only students who reported having sexual intercourse during the past three months.
BMI & Perceptions of Weight
Obesity and Overweight

For youth, BMI, body mass index, is age- and sex-specific and is expressed as a percentile based on weight and height. Youth are considered overweight if their BMI percentile is 85 or above and obese if their BMI is above the 95th percentile.

About a quarter of high school students have a weight-height ratio above the 85th percentile for their age and sex. Specifically, 14% of students are overweight and have a BMI ratio between the 85th and <95th percentile; 14% of students have a BMI ratio above the 95th percentile and are considered obese.

- Being overweight does not differ by sex or race and ethnicity. Obesity does not differ by grade level.
- Male students are significantly more likely to be obese compared to female students.
- 9th grade students are significantly more likely than older students to be overweight. 10th grade students are also significantly more likely than 12th grade students to be overweight.
- BIPOC students are significantly more likely then white, non-Hispanic students to be obese.
- LGBTQ+ students are significantly more likely to be overweight and obese compared to heterosexual cisgender students.

**High School Students who Were Overweight and Obese**

- Obese (>=95%ile)
- Overweight (>=85 - <95 %ile)
Perceptions of Weight

About half of all students (53%) believe they are about the right weight; 29% believe they are slightly or very overweight; 18% believe they are slightly or very underweight (data not shown). Perceptions of weight among male and female students are shown below.

High School Students Perceptions of Weight, By Sex

Female
- About the right weight: 55%
- Overweight: 32%
- Underweight: 13%

Male
- About the right weight: 51%
- Overweight: 26%
- Underweight: 22%
Weight Modifications

Overall, four in ten students (41%) are trying to stay the same weight or not doing anything about their weight; 41% of students are trying to lose weight and 18% are trying to gain weight.

High School Students Attempts to Modify Weight, by Sex

Female
- Lose weight: 52%
- Stay the same weight / Doing nothing: 41%
- Gain weight: 7%

Male
- Lose weight: 30%
- Gain weight: 28%
- Stay the same weight / Doing nothing: 42%
Physical Activity
The U.S. Department of Health and Human Services Guidelines for Physical Activity recommend youth participate in 60 minutes of physical activity every day.

About a quarter of students meet physical activity guidelines.
More than a quarter of high school students are physically active for at least 60 minutes every day.

- Male students are two times as likely as female students to engage in at least 60 minutes of physical activity every day.
- 9th grade students are significantly more likely than older students to engage in daily physical activity during the past week. 10th grade students are also significantly more likely than 12th grade students to engage in daily physical activity.
- Engaging in daily physical activity does not differ by race and ethnicity.
- Heterosexual cisgender students are more than two times as likely as LGBTQ+ students to engage in daily physical activity.

Overall, about half of high school students were physically active for at least 60 minutes on five or more days during the previous week.

During the previous week,
- Male students are significantly more likely than female students to engage in physical activity on at least five days.
- 9th grade students are significantly more likely than older students to engage physical activity on at least five days. 10th grade students are also significantly more likely than 12th grade students to be physically active on most days during the previous week.
- White, non-Hispanic students are significantly more likely than BIPOC students to engage in physical activity on five or more days.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to engage in physical activity on at least five days.

High School Students who Participated in at Least 60 Minutes of Physical Activity on at Least Five Days, Past Week
More than one in ten students did not participate in 60 minutes of physical activity on any day during the previous week.

- Female students are significantly more likely than male students to report no physical activity during the previous week.
- 12th grade students are significantly more likely than younger students to not engage in physical activity on any day during the previous week. 11th grade students are also more likely than 9th grade students to engage in no physical activity during the past week.
- BIPOC students are significantly more likely to report no physical activity on any day during the previous week compared to white, non-Hispanic students.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to report no physical activity on any day during the previous week.
Questions about “screen time” were revised in 2021. Students were asked about time spent in front of a TV, computer, smart phone, or other electronic device watching shows or videos, playing games, accessing the internet, or using social media for things other than schoolwork.

On the average school day, about three-quarters of students spend three or more hours in front of a TV, computer, smart phone, or other electronic device watching shows or videos, playing games, accessing the internet, or using social media.

- Three or more hours a day of screen time does not differ by sex, grade level, or race.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to spend three or more hours per school day on screen time.
Nutrition
During the past week, nearly three in ten students ate fruit or drank 100% fruit juice at least two times per day. 6% of students did not drink 100% fruit juice or have any fruit during the previous week. Fruit consumption at least twice a day does not differ by grade level. The following students are significantly more likely to consume fruit or 100% juice at least two times per day during the past week:
- Male students,
- BIPOC students, and
- Heterosexual cisgender students.

Social Determinants of Health
Food Insecurity

During the past month, 2% of high school students went hungry always or most of the time because there was not enough food available; 84% never went hungry during the previous month.

The following students are significantly more like to go hungry at least most of the time:

- Male students,
- BIPOC students, and
- LGBTQ+ students.

High School Students who Always or Most of the Time Went Hungry Because There was Not Enough Food in Their Home, Past 30 Days
Housing Insecurity

Those experiencing housing insecurity includes students who responded that they usually slept in the home or a friend, family member, or other person because they had to leave their home or a parent or guardian cannot afford housing; in a shelter or emergency housing, in a motel or hotel; in a car, park, campground, or other public place; or that they did not have a usual place to sleep.

During the past 30 days, 96% of students primarily slept in the home of their parents or guardian; 3% of experienced housing insecurity, sleeping in places such as someone’s house, emergency housing, shelters, hotels or motels, or other public places.

- Male students are significantly more likely to experience housing insecurity compared to female students.
- 12th grade students are significantly more likely than younger students to experience housing insecurity.
- BIPOC students are significantly more likely than white, non-Hispanic students experience housing insecurity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students experience housing insecurity.

High School Students who Experienced Housing Insecurity, Past 30 Days
Subjective Social Status

Subjective social status (SSS) is a proxy measure for socioeconomic status. It asks students to compare their family to others in American society by imagining a ladder. At the top of the ladder are people who are the best off – they have the most money, highest amount of schooling, and jobs that bring the most money. At the bottom of the ladder are people who are the worst off – they have the least money, little or no education, no job or jobs that no one wants or respects.

Overall, most students believe they are in the middle of the ladder or that their family is somewhat similar to others in American society. One in seven believe their family is better off, 2% believe their family is worse off than others in American society.

- Male students are significantly more likely than female students to think their family's social status is worse compared to other Americans.
- Subjective social status does not significantly differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to think their family's social status is worse compared to other Americans.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to think their family's social status is worse compared to other Americans.

School Has Clear Rules and Consequences for Behaviors

- Agree / Strongly Agree: 55%
- Disagree / Strongly Disagree: 23%
- Not Sure: 22%
Access to Help

When feeling sad, angry, hopeless, or anxious, a third of students reported that they could always or at least most of the time get the kind of help they need. One in five students feel they never get the kind of help they need.

- Male students are significantly more likely than female students to get the kind of help they need at least most of the time.
- 9th grade students are significantly more likely than 10th grade students to get the kind of help they need at least most of the time.
- White, non-Hispanic students are significantly more likely than BIPOC students to get the kind of help they need at least most of the time.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to get the kind of help they need at least most of the time.
Participation in Extracurricular Activities

During a typical week, a quarter of students spend ten hours or more participating in extracurricular activities such as sports, band, drama, or clubs run by the school or the community; more than a third did not participate in any activities.

- Participating in at least ten hours of extracurricular activities does not differ by sex.
- 9th grade students are significantly less likely to participate in at least ten hours of extracurricular activities each week compared to their peers. 12th grade students are significantly more likely than 10th grade students to participate in ten or more hours of extracurricular activities.
- White, non-Hispanic students are significantly more likely than BIPOC students to participate in at least ten hours of extracurricular activities.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to participate in ten or more hours of extracurricular activities.

High School Students who Participate in Ten or More Hours Per Week of Extracurricular Activities, Average School Week
Post Graduation Plans

After high school more than two-thirds of high school students believe they will most likely attend a 4-year college or university, a community college or a technical school. Two in ten students were not sure what they will do after graduation.

- Female students are significantly more likely than male students to believe they most likely will attend a college or university, a community college, or technical school after high school.
- Planning on attending a college or university, a community college, or technical school significantly increases with each grade level.
- Believing they will most likely attend a college or university, a community college, or technical school after high school does not differ by race and ethnicity or sexual orientation and gender identity.

Community Connectedness: Matter to Others

Just over half of all high school students agree or strongly agree that in their community they matter to people; 16% do not believe they matter to the people in their community (disagree or strongly disagree).

- Males are significantly more likely to feel they matter to people in their community compared to female students.
- 12th grade students are significantly more likely than 10th and 11th grade students to feel that they matter to people in their community.
- White, non-Hispanic students are significantly more likely than BIPOC students to feel like they matter to people in their community.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to feel like they matter to people in their community.

New in 2021

Modifications are typically made to reflect new research recommendations, rising areas of concern, or societal changes. Copies of the Vermont YRBS questionnaires are available online at www.healthvermont.gov/yrbs.

### New and Modified Questions

- Exposure to community violence
- Screen time
- Where usually sleep (housing insecurity)
- Poor mental health
- Feeling nervous, anxious, or on edge
- Able to talk to an adult about feelings
- Additional response options for sexual orientation were added
Sample & Demographics
2021 Sample and Response Rate

Between September and December 2021, students at 106 middle schools took the 2021 Vermont Youth Risk Behavior Survey. Survey procedures protected the privacy of students by allowing for anonymous and voluntary participation and completion during a single class period.

This report presents the middle school results from schools that include students in grades six through eight. Elementary or intermediate schools ending in sixth grade are not eligible to participate. The results in this report are weighted by gender, grade, and race/ethnicity to compensate for absenteeism and incomplete surveys.

Overall, 12,210 middle school students completed the 74-item 2021 Vermont YRBS.

<table>
<thead>
<tr>
<th>Middle School Response Rate †</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schools - 91% (106 of the 116 eligible schools)</td>
</tr>
<tr>
<td>Students - 83% (12,210* of 14,617 students submitted usable questionnaires)</td>
</tr>
<tr>
<td>Overall response rate - 91% * 83% = 76%</td>
</tr>
</tbody>
</table>

† Overall response rate is computed as (number of participating schools/number of eligible sampled schools) * (number of usable questionnaires / number of eligible students sampled in participating schools).

* 12,136 of the 12,212 submitted middle school questionnaires were usable after data editing.

^ SOGI: sexual orientation and gender identity.
Personal Safety
Violence & Bullying
Nearly four in ten students reported that they have ever been in a physical fight.

- Male students are significantly more likely than female students to have ever been in a physical fight.
- Ever being in a physical fight does not differ by grade level or sexual orientation and gender identity.
- BIPOC students are significantly more likely than white, non-Hispanic students to report every being in a physical fight.

Middle School Students who Were Ever in a Physical Fight
Overall, four in ten middle school students have ever been bullied at school.

- Female students are significantly more likely than male students to have ever been bullied on school property.
- 6th grade students are significantly less likely than 7th grade students to report ever being bullied on school property.
- Ever being bullied on school property does not differ by race and ethnicity.
- LGBTQ+ students are significantly more likely to have ever been bullied at school compared to heterosexual cisgender students.

On the YRBS, bullying is defined as when one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way. Electronic bullying is described as bullying through texting, Instagram, Facebook, or other social media sources.
Bullying, Past 30 Days

Nearly a quarter of students were bullied during the past 30 days. More than one in ten students were bullied on more than two days (11%).

- Female students are significantly more likely than male students to have been bullied during the past 30 days.
- 8th grade students are significantly less likely than students in 6th and 7th grade to have been bullied during the past 30 days.
- Bullied during the past 30 days does not differ by race and ethnicity.
- LGBTQ+ students are more than two times as likely as heterosexual cisgender students to have been bullied in the past 30 days.

Middle School Students who Were Bullied, Past 30 Days

The YRBS defines bullying if one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way. Electronic bullying occurs through texting, Instagram, Facebook, or other social media.
Bullying Others

During the previous 30 days, 8% of students reported bullying others.

- Bullying other students does not differ by sex.
- Students in 6th grade are significantly less likely to bully others in the past 30 days compared to students in 7th and 8th grade.
- BIPOC students are significantly more likely to bully others compared to white, non-Hispanic students.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to bully someone else during the past 30 days.

The YRBS defines bullying if one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way. Electronic bullying occurs through texting, Instagram, Facebook, or other social media.
About three in ten middle school students have ever been electronically bullied.

- Female students are significantly more likely than male students to have ever experienced electronic bullying.
- 6th grade students are significantly less likely to have ever experienced electronic bullying compared to students in 7th and 8th grade.
- BIPOC students are significantly more likely than white, non-Hispanic students to be bullied electronically.
- LGBTQ+ students are significantly more likely to have ever been electronically bullied compared to heterosexual cisgender students.

**Middle School Students who Were Ever Electronically Bullied**

The YRBS defines bullying if one or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when two students of about the same strength or power argue or fight or tease each other in a friendly way. Electronic bullying occurs through texting, Instagram, Facebook, or other social media.
Feeling Unsafe

During the previous 30 days, one in ten students skipped school because they felt unsafe at school or on their way to or from school. Five percent of students skipped school more than one time (data not shown).

- Female students are significantly more likely than male students to skip school because they felt unsafe during the past month.
- Skipping school because they feel unsafe does not differ by grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to skip school because they felt unsafe.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to skip school during the past 30 days because they felt unsafe.

Substance Use
Lifetime Substance Use
Ever Using Cigarettes, Alcohol, and Marijuana Before Age 11

Nearly one in ten middle school students tried alcohol before they turned 11 years old. Before they turned 11 years old, 3% of middle school students tried a cigarette; 1% tried marijuana.

Middle School Students who Used Cigarettes, Alcohol, or Marijuana Before Age 11

- Cigarettes: 3%
- Alcohol: 8%
- Marijuana: 1%
Lifetime Cigarette Use

Overall, 6% of students have ever tried a cigarette.

- Ever trying a cigarette does not differ by sex.
- Ever trying a cigarette significantly increases with each grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to ever try a cigarette.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have ever tried a cigarette.

Middle School Students who Ever Tried a Cigarette
Just under one in ten middle school students have ever tried an electronic vapor product (EVP).

Electronic vapor products (EVP) include e-cigarettes, vapes, vape pens, e-cigars, e-hookahs, hookah pens, and mods. Common products include: JUUL, Vuse, MarkTen, and blu.

- Female students are significantly more likely than male students to have ever tried an EVP.
- EVP use significantly increases with each grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to ever try an EVP.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to ever try an EVP.
Flavored tobacco products are flavored to taste like menthol (mint), clove, spice, alcohol (wine or cognac), candy, fruit, chocolate, or other sweets.

Overall, 5% of middle school students have ever tried a flavored tobacco product.

- Female students are significantly more likely than male students to have ever tried a flavored tobacco product during their lifetime.
- 8th grade students are significantly more likely than students in 6th and 7th grades to have ever tried a flavored tobacco product.
- BIPOC students are significantly more likely than white, non-Hispanic students to have ever tried flavored tobacco products.
- LGBTQ+ students are two times as likely as heterosexual cisgender students to have ever tried a flavored tobacco product.
One in seven middle school students have ever drank alcohol.

- Ever drinking alcohol does not differ by sex or race and ethnicity.
- Ever drinking alcohol significantly increases with each grade level.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have ever drank alcohol.

Overall, 4% of students have ever used inhalants such as sniffing glue, breathing in the contents of spray cans, or inhaling any paints or sprays to get high.

- Inhalant use among middle school students does not differ by sex, grade level, or race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have ever used inhalants.
Current Tobacco Use

One in 20 middle school students used a cigarette, cigar, smokeless tobacco, or EVP during the past 30 days. Excluding EVP, 2% of students used a cigarette, cigar, or smokeless tobacco products during the past 30 days.

- Female students are significantly more likely than male students to use of cigarettes, cigars, smokeless tobacco, or EVPs during the past 30 days.
- Current use of cigarettes, cigars, smokeless tobacco, or EVPs significantly increases with each grade level.
- BIPOC students are significantly more likely than white, non-Hispanic students to use cigarettes, cigars, smokeless tobacco, or EVPs during the past 30 days.
- LGBTQ+ students are twice as likely than heterosexual cisgender students to use cigarettes, cigars, smokeless tobacco, or EVPs during the past 30 days.

Middle School Students who Used Cigarettes, Cigars, Smokeless Tobacco, or EVPs, Past 30 Days
Current Cigarette Use

Overall, 1% of students smoked cigarettes in the past 30 days.

- Current cigarette use does not differ by sex.
- 8th grade students are significantly more likely than their peers to smoke cigarettes during the past 30 days.
- BIPOC students are significantly more likely than white non-Hispanic students to have smoked cigarettes during the past 30 days.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have smoked cigarettes during the past 30 days.
Cigarette Use Among Current Smokers

FREQUENCY OF CIGARETTE SMOKING

Among middle school students who smoked cigarettes during the past 30 days, about four in ten smoked on one to two days; a third smoked on ten or more days (32%).

Among current users:

- Smoking cigarettes on one or two days does not differ by sex or sexual orientation and gender identity.
- There were too few students who used cigarettes on one or two days to provide statistical comparisons by grade or race and ethnicity.

More than four in five middle school students believed their parents would think it is very wrong for them to use marijuana, or EVPs. About two-thirds believe their parents would feel it would be very wrong for them to drink alcohol.

A few were not sure how their parents would feel about them drinking alcohol, using marijuana, or EVP.
Parental Disapproval

Approximately nine in ten students believe that their parents feel it is wrong or very wrong for them to use alcohol, marijuana, and EVP.

- Believing their parents would think it is wrong for them to use alcohol, marijuana, or EVP does not differ by sex.
- Eighth grade students are significantly less likely than 6th and 7th grade students to believe their parents feel it is wrong for them to use alcohol or marijuana and significantly less likely than 7th grade students to believe their parents feel it is wrong for them to use EVP.
- White, non-Hispanic students are significantly more likely to believe their parents feel it is wrong for them to use marijuana, or EVP.
- Heterosexual cisgender students are significantly more likely to believe their parents feel it is wrong for them to use alcohol, marijuana, or EVP.
Less than a quarter of middle school students believe people face no risk or slight risk of harm if they binge drink every weekend, use marijuana regularly, or use EVP regularly.
At least four in ten students believe people greatly risk harming themselves if they binge drink each weekend, use marijuana regularly, or use EVP regularly.

- Female students are significantly more likely to believe people greatly risk harming themselves if they binge drink each weekend.

- Perceived harm from using marijuana and EVP regularly decreases with each grade level; 6th grade students are more likely than 7th and 8th grade students to believe people greatly risk harming themselves if they binge drink each weekend.

- BIPOC students are significantly more likely than white, non-Hispanic students to think people greatly risk harming themselves if they binge drink each weekend.

- Heterosexual cisgender students are significantly more likely to believe people greatly risk harming themselves if they use marijuana regularly or use EVP regularly.
Nearly half of all middle school students think it would be very hard to access alcohol. Three-quarters believe it would be very hard to access marijuana. Two-thirds believe it would be very hard to access EVPs.
A third of middle school students believe it would be easy or very easy to access alcohol. About one in six believe it would be easy or very easy to access marijuana or EVP.

- Female students are significantly more likely to believe it would be easy to access alcohol, marijuana, or EVP.
- Believing that it would be easy to access alcohol, marijuana, or EVP increases with each grade level.
- BIPOC students are significantly more likely to believe it would be easy to access marijuana.
- LGBTQ+ students are significantly more likely to believe it would be easy to access alcohol, marijuana, or EVP.
Sexual Activity
Overall, 3% of students have ever had sexual intercourse.

- Ever having sexual intercourse does not differ by sex.
- 8th grade students are significantly more likely than their peers to have ever had sexual intercourse.
- BIPOC students are significantly more likely than white, non-Hispanic students to have ever had sexual intercourse.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to have ever had sexual intercourse.

Physical Activity & Nutrition
Physical Activity
Physical Activity

Current physical activity guidelines state that youth should participate in 60 minutes or more of physical activity daily. Most of that activity should be either moderate- or vigorous-intensity aerobic activity.

During the previous week, more than a third of middle school students engaged in at least 60 minutes of physical activity every day. More half engaged in physical activity on at least five days during the previous week. Less than one in ten students did not participate in any physical activity.

Days Spent Being Physically Active for 60+ Minutes, Past Week

- 7 days: 35%
- 5 to 6 days: 25%
- 3 to 4 days: 19%
- 1 to 2 days: 11%
- 0 days: 9%
Overall, 35% of middle school students meet current physical activity guidelines and were physically active for at least 60 minutes everyday during the past week.

- Male students are significantly more likely than female students to meet physical activity guidelines.
- 6th grade students are significantly more likely than 8th grade students to engage in at least 60 minutes of physical activity everyday.
- Engaging in 60 minutes of physical activity every day does not differ by race and ethnicity.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to engage in 60 minutes of physical activity every day.

Physical Activity: Met or Approached Recommendations

PHYSICALLY ACTIVE FOR AT LEAST 60 MINUTES ON FIVE OR MORE DAYS, PAST WEEK

Six in ten middle school students were active for at least 60 minutes on five or more days during the previous week.

- Male students are significantly more likely than female students to engage in physical activity on five or more days during the previous week.
- Being physically active on at least five days during the previous week does not differ by grade level.
- White, non-Hispanic students are significantly more likely than BIPOC students to be physically active for at least 60 minutes on at least five days during the previous week.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to engage in 60 minutes of physical activity on at least five days during the previous week.

Middle School Students who Were Physically Active for 60+ Minutes on Five or More Days, Past Week

- 2021: M = 60%, F = 56%, WnH = 61%, BIPOC = 59%, HetCis = 62%, LGBTQ = 45%
- 2022: M = 65%, F = 61%, WnH = 61%, BIPOC = 55%, HetCis = 68%, LGBTQ = 45%
Overall, less than one in ten students did not engage in 60 minutes of physical activity on any day during the past week.

- Not participating in 60 minutes of physical activity on any day during the past week does not differ by sex.
- 6th grade students are significantly more likely than 8th grade students to not participate in 60 minutes of physical activity on any day during the past week.
- BIOPC students are significantly more likely than white, non-Hispanic students to not participate in 60 minutes of physical activity during the past week.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to not participate in 60 minutes of physical activity during the past week.
Physical Activity Breaks at School

Nearly nine in ten middle school students have at least one physical activity break at school during a typical week. More than half have opportunities for physical activity breaks every day (52%).

- Having at least one physical activity break during class does not differ by sex or race and ethnicity.
- 6th grade students are significantly more likely than 8th grade students to have at least one physical activity break during class.
- Heterosexual cisgender students are significantly more likely to have at least one physical activity break compared to LGBTQ+ students.

On the average school day, about six in ten students spend three or more hours in front of a TV, computer, smart phone, or other electronic device watching shows or videos, playing games, accessing the internet, or using social media.

- Spending three or more hours a day on screen time does not differ by sex or race and ethnicity.
- Three or more hours of screen time significantly increases with each grade.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to engage in three or more hours of screen time.
Overall, more than half of all students drank at least three glasses of water every day during the previous week.

- Male students are significantly more likely than female students to drink three or more glasses of water per day during the previous week.
- Drinking three or more glasses of water per day during the previous week does not differ by grade level or race and ethnicity.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to drink three or more glasses of water per day.

**Middle School Students who Drank Three or More Glasses of Water Every Day, Past Week**
Less than half of all students ate breakfast every day during the previous week.

- Male students are significantly more likely than female students to eat breakfast every day during the previous week.
- Eating breakfast every day decreases with each grade level.
- Eating breakfast every day does not differ by race and ethnicity.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to eat breakfast every day.

Social Determinants of Health
Less than 10% of students live with someone who primarily speaks a language other than English most of the time or always.

- Living with someone who most of the time or always speaks a language other than English does not differ by sex or sexual orientation and gender identity.
- 6th grade students are significantly more likely than 7th and 8th grade students to live with someone who most of the time or always speaks a language other than English.
- BIPOC students are significantly more likely than white, non-Hispanic students to live with someone who most of the time or always speaks a language other than English.

**Language Other than English Spoken at Home**

- Most of the time / Always: 7%
- Sometimes: 10%
- Rarely: 21%
- Never: 62%
During the past 30 days, 2% of middle school students went hungry most of the time or always because there was not enough food at home. Three-quarters of students never went hungry.

- Going hungry always or most of the time because there was not enough food at home does not differ by sex or grade level.
- BIPOC students are nearly eight times more likely than white, non-Hispanic students to go hungry always or most of the time because there was not enough food at home.
- LGBTQ+ students significantly more likely than heterosexual cisgender students to go hungry always or most of the time because there was not enough food at home.
During the past 30 days, 2% of students experienced housing insecurity, sleeping in the home of other people, a shelter or emergency housing, motel / hotel, in a public place, or did not have a usual place to stay.

- Experiencing housing insecurity does not differ by sex, grade level, or race and ethnicity.
- LGBTQ+ students are significantly more likely than heterosexual cisgender students to experience housing insecurity.
Youth Assets and Other Protective Factors
Nearly nine in ten students ate dinner with their parent or guardian at least four times during the previous week; few (5%) never did so.

- Male students are significantly more likely than female students to eat dinner with a parent or guardian at least four times in the previous week.
- Eating dinner with a parent or guardian four or more times during the previous week significantly decreases with each grade level.
- White, non-Hispanic students are significantly more likely than BIPOC students to eat dinner with a parent four or more times during the previous week.
- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to eat dinner with a parent four or more times during the previous week.
About six in ten students feel they can talk to a caring adult or an adult in their family about their feelings at least most of the time.

- Male students are significantly more likely than female students to feel like they can talk to an adult about their feelings at least most of the time.

- 8th grade students are significantly less likely than 6th and 7th grade students to feel like they can talk to an adult about their feelings at least most of the time.

- White, non-Hispanic students are significantly more likely than BIPOC students to feel like they can talk to an adult about their feelings at least most of the time.

- Heterosexual cisgender students are significantly more likely than LGBTQ+ students to feel like they can talk to an adult about their feelings at least most of the time.
