

2021 Healthcare-Acquired Infection Report

Comparative Report

1. Influenza Immunization – for the patients (IMM-2)

Increasing influenza vaccination can reduce unnecessary hospitalizations and secondary complications. Vaccination is the most effective way to prevent influenza and is associated with reductions in influenzas among all age groups. This measure addresses hospitalized inpatients age 6 months and older who were screened for seasonal influenza immunization status and were vaccinated prior to discharge. **Higher rates are better.**

Hospital Name	Results (%)	Reporting Period
