Introduction: Risk Factors and Prevention

Cancer is a group of more than 100 different diseases that often develop gradually as the result of a complex mix of lifestyle, environmental, social and genetic factors.

People are at higher risk for certain cancers due both to factors related to personal behaviors such as: diet, physical inactivity, tobacco use, alcohol use, and overexposure to sunlight; and to social determinants of health such as race/ethnicity, income-level, disability status, and sexual identity and orientation.

This chapter of the Vermont Cancer Data Pages, Risk Factors and Prevention, explores the personal behaviors of Vermonters that are known to increase or decrease the risk of developing cancer.

Note: Throughout this report, data comparisons presented as “higher,” “lower,” “larger,” “smaller,” “better,” “worse,” or as “significantly different” are all considered statistically significant differences. Statistical significance is assessed by comparing the confidence intervals of different groups.
Vermont Health Equity Priority Populations

The Vermont Department of Health (VDH) recognizes that some individuals are more likely to be affected by cancer than others due to social, environmental and economic disadvantages.

In developing the 2025 Vermont Cancer Plan, four populations of focus were chosen to track to assess disparities in health behaviors and outcomes. These four populations are highlighted in these data pages as well to support work focusing on decreasing disparities.

The four populations of focus are defined in the following ways, based on VDH’s main data sources:

• **Black, Indigenous and people of color (BIPOC):** Individuals who self-identified that they were of Hispanic, Latino/a, or Spanish origin, and/or responded that their race is one or more of the following: Black or African American, American Indian and/or Alaska Native, Asian, Pacific Islander.

• **Lesbian, gay, bisexual, transgender and queer (LGBTQ+) Vermonters:** Data sources only ask respondents to self-identify if they are lesbian, gay, bisexual and/or transgender. To best represent the available data therefore, we use LGBT when discussing findings from these data sources, while also acknowledging that these data do not fully represent the LGBTQ+ community.

• **Vermonters living with disabilities:** Individuals who self-identified as having one or more of the following conditions: sight impairment, being deaf or having serious difficulty hearing, difficulty walking, difficulty making decisions, difficulty doing errands alone, difficulty getting dressed alone.

• **Low-income Vermonters:** Individuals who have a household income that is 250% or less of the federal poverty limit.
Physical Activity

Vermonters meet current physical activity guidelines more than the U.S. population.

All estimates are age-adjusted to the 2000 U.S. standard population.

Vermont Department of Health Source: BRFSS 2019
Physical Activity

BIPOC and White, Non-Hispanic adults meet current physical activity recommendations at a similar rate.

61% BIPOC
57% White
60% Vermont

LGBT and Non-LGBT adults meet current physical activity recommendations at a similar rate.

63% LGBT
60% Non-LGBT
60% Vermont

Adults with a disability are less likely to meet current physical activity recommendations than those without a disability.

49% Disability
64% No Disability
60% Vermont

Adults with a low income are less likely to meet current physical activity recommendations than those that are not low-income.

53% Low Income
67% Not Low Income
60% Vermont

Vermont Department of Health Source: BRFSS 2017, 2019

All estimates are age-adjusted to the 2000 U.S. standard population
Eat at Least Five Servings of Fruits and Vegetables

The % of Vermonters eating at least five servings of fruits and vegetables in each county is like that of Vermont in general.

All estimates are age-adjusted to the 2000 U.S. standard population
Vermont Department of Health Source: BRFSS 2017 and 2019

+US data from BRFSS 2019 for this measure are not yet available. This page will be updated when data are available.
### Eat at Least Five Servings of Fruits and Vegetables

**BIPOC and White, Non-Hispanic adults eat at least 5 servings of fruits and vegetables at a similar rate.**

Vermont Department of Health Source: BRFSS 2017, 2019

All estimates are age-adjusted to the 2000 U.S. standard population.
Sunburns: Adults

The % of Vermonters that had a sunburn in the past year in each county is like that of Vermont as a whole.
Sunburns: Adults

Vermonters ages 18-44 are **more likely** to have had a sunburn in the past year than Vermont adults in general.

Vermonters ages 65 and older are **less likely** to have had a sunburn in the past year.

26% of Vermont adults have had 2 or more sunburns in the past year.

\[\text{71\%} \quad \text{67\%} \quad \text{56\%} \quad \text{40\%} \quad \text{18\%}\]

\[\text{18-24} \quad \text{25-34} \quad \text{35-44} \quad \text{45-64} \quad \text{65+}\]

Vermont Department of Health Source: BRFSS 2019
Sunburns: Adults

BIPOC adults are less likely than White, Non-Hispanic Vermonters to have had a sunburn in the past year.

- BIPOC: 29%
- White: 45%

LGBT and Non-LGBT adults have had at least one sunburn in the past year at a similar rate.

- LGBT: 46%
- Non-LGBT: 44%

Adults with a disability are less likely to have had a sunburn in the past year than those without a disability.

- Disability: 32%
- No Disability: 47%

Adults with and without a low income have had at least one sunburn in the past year at a similar rate.

- Low Income: 49%
- Not Low Income: 54%

Vermont Department of Health Source: BRFSS 2019
Sunburns: High School

High school students in **Addison, Windsor and Windham Counties** are more likely to have had a sunburn in the past year than high school students in general.

Those in **Caledonia County** are less likely to have had a sunburn.
Sunburns: Middle School

Middle school students in **Addison and Rutland Counties** are more likely to have had a sunburn in the past year than middle school students in general.

Those in **Essex County** are less likely to have had a sunburn.

Vermont Department of Health Source: YRBS 2019
Female students in both high school and middle school were more likely to have had a sunburn in the past year than male students.
Number of Sunburns: High School and Middle School

60% of high school students had 2 or more sunburns in the past year.

51% of middle school students had 2 or more sunburns in the past year.

Vermont Department of Health Source: YRBS 2019
Number of Sunburns: High School

67% of female high school students had 2 or more sunburns in the past year.

- 50% had 3+ sunburns
- 17% had 2 sunburns
- 11% had 1 sunburn
- 21% had 0 sunburns

53% of male high school students had 2 or more sunburns in the past year.

- 34% had 3+ sunburns
- 19% had 2 sunburns
- 15% had 1 sunburn
- 32% had 0 sunburns

Vermont Department of Health Source: YRBS 2019
55% of female middle school students had 2 or more sunburns in the past year.

47% of male middle school students had 2 or more sunburns in the past year.

Vermont Department of Health Source: YRBS 2019
Obesity

Adults in Orleans, Orange and Rutland Counties have obesity at a higher rate than Vermonter's in general.

Those in Chittenden County have obesity at lower rates.

All estimates are age-adjusted to the 2000 U.S. standard population
Vermont Department of Health Source: BRFSS 2018 and 2019

+US data from BRFSS 2019 for this measure are not yet available. This page will be updated when data are available.
Obesity

BIPOC and White, Non-Hispanic adults have obesity at a similar rate.

LGBT and Non-LGBT adults have obesity at a similar rate.

Adults with a disability are more likely to have obesity than those without a disability.

Adults with a low income are more likely to have obesity than those that do not have a low income.

Vermont Department of Health Source: BRFSS 2018, 2019

All estimates are age-adjusted to the 2000 U.S. standard population.
Smoking

Vermont adults smoke at a higher rate than the U.S. population.

14%  16%
US  Vermont

Adults in Orleans County smoke at a higher rate than Vermon ters in general. Those in Chittenden County smoke at a lower rate.

All estimates are age-adjusted to the 2000 U.S. standard population

Vermont Department of Health Source: BRFSS 2019
Smoking

BIPOC adults are more likely to smoke than White, Non-Hispanic adults.

- No Disability: 9%
- Vermont: 8%

Adults with and without a low income drink heavily at a similar rate.

- Low Income: 8%
- Not Low Income: 10%
- Vermont: 8%
HPV Vaccination, Ages 13-17

The rate of adolescents who have completed the HPV vaccine series varies widely across the state, with most counties falling under the statewide rate.

Having completed the HPV vaccine series requires adolescents who received the first dose before their 15th birthday to receive two doses, and those that received the first dose after their 15th birthday to receive 3 doses.

Vermont Department of Health Source: Vermont Immunization Registry, April 2021
**Data Sources and Notes**

**Behavioral Risk Factor Surveillance System (BRFSS):** Vermont tracks risk behaviors using this telephone survey of adults. The results are used to plan, support, and evaluate health promotion and disease prevention programs. Vermont, along with the 49 other states and three territories, has participated in the BRFSS with the Centers for Disease Control and Prevention (CDC) since 1990. An adult (18 or older) in the household is asked a uniform set of questions. The results are weighted to represent the adult population of the state.

**Youth Risk Behavior Survey (YRBS):** Every two years since 1993, the Department of Health's Division of Alcohol and Drug Abuse Program and the Department of Education's Coordinated School Health Programs have sponsored the YRBS. The YRBS measures the prevalence of behaviors that contribute to the leading causes of death, disease, and injury among youth. The YRBS is part of a larger effort to help communities increase the “resiliency” of young people by reducing high risk behaviors and promoting healthy behaviors.

**Vermont Immunization Registry (IMR):** A confidential system for maintaining immunization records for all Vermont residents and those who seek medical care in Vermont. It was designed, developed, and is operated by the Vermont Department of Health, and was first made available to providers in July 2004. It receives immunization data from medical providers, hospitals, health insurers, and increasingly, from pharmacies and nursing homes. The advantage of using the IMR for immunization data is that unlike survey information, it is much more comprehensive, and is not subject to selection bias. As is the case with any large database, the IMR has its limitations. It can be very difficult to keep up with the residences of all these individuals, resulting in a larger population base in the registry than actually live in the state of Vermont. The data shown in this chapter represent vaccine completion rates as of April 2021.

**Age Adjustment:** Many measures throughout this document are age adjusted. Age adjustment eliminates variation that results from differences in a populations’ age distributions. Measures from BRFSS are adjusted for age only if they are Healthy Vermonters 2020 goals. Age adjustment groupings come from those determined by Healthy People 2020.
