The population of Vermonters who are Black, Indigenous, and people of color (BIPOC) have faced disparities throughout the COVID-19 pandemic. BIPOC Vermonters continue to have a lower vaccination rate (79.6%) than those who are non-Hispanic white (80.5%) as of October 22, 2021. This gap decreased over time from 13% in March to less than 1% in October.

While non-Hispanic whites have higher vaccination rates than BIPOC Vermonters, the gap has decreased from a peak of 13% to less than 1%.

White Vermonters (including Hispanic white Vermonters) age 12 and older have the highest vaccination rates (83%), followed by Black Vermonters (79%). Asian Vermonters and those with two or more races follow at 75%. Vermonters who identify as Pacific Islanders (34%) or Native American, Indigenous, or First Nation (30%) are the least likely to have received at least one dose of the COVID-19 vaccine. A higher proportion of Hispanics (95%) received a vaccine than non-Hispanics (80%).

For Vermonters 12+, whites have the highest vaccination rates.

Note: Race/ethnicity information is missing for 5% of people vaccinated.

Data sources: Vermont Immunization Registry (IMR); Vermont Department of Health Population estimates (2019)
Race/Ethnicity Patterns by Age Groups (12-30, 31-64, and 65+)

- Pacific Islander and Native American, Indigenous, or First Nation Vermonters have lower vaccination rates than white, Black, Asian and multiracial Vermonters within each age group.
- Hispanic Vermonters have a higher vaccination rate than non-Hispanic Vermonters in all age groups.
- Black Vermonters have the highest vaccination rates for ages 12-30, followed by white and Asian Vermonters who have similar rates for this age group.
- For ages 31-64, multiracial Vermonters have the highest rates. White, Black, and Asian Vermonters follow with slightly lower, similar rates.
- Multiracial and white Vermonters have the highest rates for ages 65+. Black and Asian Vermonters in this age range have rates similar to each other and lower than that of multiracial and white Vermonters.

BIPOC Vermonters have higher COVID-19 vaccination rates than non-Hispanic whites in the two younger age groups, but not the oldest age group.

More than 3,600 of the 3,800 BIPOC Vermonters who are aged 65+ have received at least a first dose of a COVID-19 vaccine. About 14,900 of the nearly 17,500 BIPOC Vermonters aged 31-64 have received at least a first dose. About 11,900 of the nearly 17,000 BIPOC Vermonters aged 12-30 have received at least one dose of a COVID-19 vaccine.

Vaccination rates by race and ethnicity vary by age group and county.

Rates for BIPOC Vermonters are significantly lower than rates for non-Hispanic whites in these age groups and counties.

**Ages 12-30:** Grand Isle, Windham

**Ages 31-64:** Addison, Caledonia, Franklin, Grand Isle, Rutland, Windham

**Ages 65+:** Caledonia, Franklin, Lamoille, Orange, Orleans, Rutland, Washington, Windsor

County findings are suppressed if either group has fewer than 50 people or if both groups have reached 95%.
Key Takeaways

The conditions in which we live, work, and play, known as the social determinants of health, affect a wide range of health outcomes. Systems of structural oppression and racism greatly impact social determinants of health. In other words, even before the COVID-19 pandemic, not everyone in Vermont had equal access to the conditions that favor health. COVID-19 shines a light on these inequities. BIPOC Vermonters are at disproportionate risk for poor health outcomes, including COVID-19. In addition, this population is at higher risk for more serious outcomes, such as hospitalization, and may lack access to information and resources. For more information on what the Vermont Department of Health is doing to mitigate racial and ethnic health disparities, please visit www.healthvermont.gov/about-us/our-vision-mission/health-equity
