Breast MRI can be reimbursed by the NCCEDP in conjunction with a mammogram when a client has a BRCA mutation, a first-degree relative who is a BRCA carrier, or a lifetime risk of 20% or greater as defined by risk assessment models, such as BRCAPRO, that are largely dependent on family history. Breast MRI can also be used to better assess areas of concern on a mammogram or for evaluation of a client with a history of breast cancer after completing treatment. Breast MRI should never be done alone as a breast cancer screening tool. Breast MRI cannot be reimbursed for by the NBCEDP to assess the extent of disease in a woman who is already diagnosed with breast cancer.

***Risk Assessment for BRCA-Related Cancer in Women: USPSTF Rating (December 2013): B**

The USPSTF recommends that primary care providers screen women who have family members with breast, ovarian, tubal, or peritoneal cancer with 1 of several screening tools designed to identify a family history that may be associated with an increased risk for potentially harmful mutations in breast cancer susceptibility genes (*BRCA1* or *BRCA2*). Women with positive screening results should receive genetic counseling and, if indicated after counseling, BRCA testing.

This also applies to women who have previously been diagnosed with cancer, if she is not currently symptomatic of or receiving active treatment for breast, ovarian, tubal, or peritoneal cancer.

USPSTF Rating (December 2013): B

Tools evaluated by the USPSTF include the Ontario Family History Assessment Tool, Manchester Scoring System, Referral Screening Tool, Pedigree Assessment Tool and FHS-7. The Referral Screening Tool (an updated version, the B-RST, is available at www.breastcancergenescreen.org and FHS-7 are the simplest and quickest to administer.

*1 These codes (99204, 99205, and 99215) are typically not appropriate for You First screening visits but may be used when provider spends extra time to do a detailed risk assessment.
