Cancer Mortality

Top 5 Fatal Cancers in Vermont per 100,000 Population (2011-2015)

- Lung and Bronchus: 45.2
- Prostate (male only): 20.2
- Breast (female only): 19.2
- Colon and Rectum: 14.1
- Pancreas: 11.1

Note: All rates are age-adjusted to the 2000 U.S. standard population.

Vermont is ranked 18th in the U.S. for lung cancer mortality.

Estimated Percentage of Cancer Attributable by Risk Factor

- Adult Diet/Obesity/Exercise: 30%
- Tobacco: 29%
- Viruses/Other Biologic Agents: 8%
- Environment/Ionizing/UV Radiation: 6%
- Reproductive Factors: 5%
- Prescription Drugs/Medical Procedures: 5%
- Family History: 4%

Leading Cancer Cause of Death

**Leading Cancer Deaths, Vermont Males, All Ages, 2011-2015**

- Lung and Bronchus: 27%
- All Other Sites: 45%
- Urinary Bladder: 4%
- Pancreas: 7%
- Colon and Rectum: 8%
- Prostate: 9%

**Leading Cancer Deaths, Vermont Females, All Ages, 2011-2015**

- Lung and Bronchus: 27%
- All Other Sites: 39%
- Breast: 13%
- Ovary: 5%
- Colon and Rectum: 9%
- Pancreas: 7%

Current Cancer Trend Data
HPV Associated Cancers

*For a definition of HPV associated cancers, please see Data Notes Section

^Annual Percent Change (APC) is used to measure trends in cancer rates over time where cancer rates are assumed to change at a constant percentage of the rate of the previous year. In this slide, the APC is reported when it is significantly different from zero (alpha = 0.05).
Lung Cancer Incidence

Data available online in Tobacco Associated Cancers - Data Brief

7 Stage of disease at diagnosis is SEER Summary Stage
8 APC is used to measure trends in cancer rates over time where cancer rates are assumed to change at a constant percentage of the rate of the previous year. Annual Percent Change (APC) is reported when it is significantly different from zero (alpha = 0.05).
Cancer Plan Status Update
Includes data on primary cancer prevention (healthy behaviors), secondary prevention (cancer screening), and tertiary prevention (improving survivorship).

Communicating Cancer Data to Vermont Healthcare Professionals
Communicating the Burden of Cancer to Healthcare Professionals
By: Allison Verbyla MPH¹, Ghazala Perveen MBBS, PHD²
¹Vermont Department of Health, Burlington, VT; ²Kansas Department of Health and Environment, Topeka, KA

Background:
Cancer is a leading cause of death in Vermont. Many behavioral risk factors such as tobacco use, poor diet, and physical inactivity greatly increase the risk of cancer. NEARLY 50% of the most common cancers CAN BE PREVENTED

State health departments collect data on behavioral risk factors, as well as cancer screening adherence and incidence for breast, cervical, and colorectal cancers. While public health programs routinely use this data for cancer prevention efforts, it is often not systematically communicated to healthcare professionals.

As a result, healthcare professionals may not be aware of the availability of this data. Healthcare professionals in Vermont may benefit from knowing the current rate of behavioral risk factors in the county they practice, as well as the rate of cancer screening.

Purpose: This study assesses healthcare professional knowledge of county-level public health data related to cancer, as well as determines a suitable way for communicating the data.

Methods:
An online survey was conducted late March to early April 2018.

Healthcare professionals were recruited through the statewide cancer coalition.

Vermont Cancer Resources:
- Kindred Connections - vcan.net/make-a-kindred-connection.html
- Vermonters Taking Action Against Cancer (VTACC) - vtacc.org
- Vermont Department of Health Cancer Plan - www.healthvermont.gov/wellness/reports/cancer
- Smoking Cessation for patients and providers - 802Quits.org

Results:
1. Less than a third of respondents were aware of the prevalence of behavioral risk factors (i.e., smoking, poor diet) in the county where they practice. Nearly half of the respondents were uncertain.

Were respondents aware of the prevalence of behavioral risk factors?

- Strongly disagreed: 6%
- Disagreed: 18%
- Neither agreed/disagreed: 41%
- Agreed: 24%
- Strongly agreed: 6%

Could respondents better serve patients by knowing the percentage of their population up-to-date on cancer screening?

- Strongly disagreed: 18%
- Disagreed: 53%
- Neither agreed/disagreed: 29%

2. Nearly all respondents felt they could better serve patients by knowing the percentage of behavioral risk factors within their county.

Could respondents better serve patients by knowing the prevalence of behavioral risk factors?

- Strongly disagreed: 0%
- Disagreed: 6%
- Neither agreed/disagreed: 53%
- Agreed: 41%
- Strongly agreed: 6%

3. Most respondents agreed they could better serve patients by knowing the percentage of their population up-to-date on cancer screening.

Could respondents better serve patients by knowing cancer screening prevalence?

- Strongly disagreed: 18%
- Disagreed: 53%
- Neither agreed/disagreed: 29%

4. Three-quarters of respondents felt they could better serve their patients by knowing whether cancer incidence in their county differs from the state.

Could respondents better serve patients by knowing if cancer incidence in their county differs from the state?

- Strongly disagreed: 6%
- Disagreed: 18%
- Neither agreed/disagreed: 41%
- Agreed: 47%
- Strongly agreed: 29%

5. Eighty-two percent of respondents agreed the availability of infographics would be beneficial to their work.

Conclusions:
Vermont healthcare professionals were somewhat aware of county-level data related to cancer. Most respondents agreed that awareness of these data, specifically prevalence of tobacco use, poor diet, and other behavioral risk factors, would improve their work. Many healthcare professionals also agreed the availability of an infographic would be helpful in communicating these data.

Final Thoughts: Recommendations
Increased access to these data in a user-friendly version may benefit healthcare professionals in Vermont.
Cancer County Infographics

To access, please visit: [http://www.healthvermont.gov/health-statistics-vital-records/surveillance-reporting-topic/cancer](http://www.healthvermont.gov/health-statistics-vital-records/surveillance-reporting-topic/cancer) and select ‘Community Data (Expand to view fact sheets and infographics).’
Behavioral Risk Factor Surveillance System (BRFSS): Vermont tracks risk behaviors using this telephone survey of adults. The results are used to plan, support, and evaluate health promotion and disease prevention programs. Since 1990, Vermont, along with the 49 other states and three territories, has participated in the BRFSS with the Centers for Disease Control and Prevention (CDC). Over 7,000 Vermonters are randomly and anonymously selected and called annually. An adult (18 or older) in the household is asked a uniform set of questions. The results are weighted to represent the adult population of the state.

Vermont Cancer Registry (VCR): The Vermont Cancer Registry (VCR) is Vermont’s statewide population-based cancer surveillance system. The registry collects information about all cancers (except non-melanoma skin cancers and carcinoma in situ of the cervix) and all benign brain tumors diagnosed in Vermont. All statistics exclude in situ carcinomas except urinary bladder, unless indicated otherwise. Vermont cases include Vermont residents only.

NPCR and SEER Incidence 1999-2015 Database (NPCR & SEER): The U.S. incidence rates are based on the National Program of Cancer Registries (NPCR) and the Surveillance, Epidemiology, and End Results (SEER) Program Incidence State Restricted Access Data File (1999-2015). A reporting delay by Department of Veterans Affairs (VA) has resulted in incomplete reporting of VA hospital cases in 2011 through 2015.

Age Adjustment: Measures from BRFSS and YRBS are adjusted for age only if they are Healthy Vermonters 2020 goals. Age adjustment groupings come from those determined by Healthy People 2020.

Confidence Intervals used for statistical comparisons: A confidence interval represents the range in which a parameter estimate could fall which is calculated based on the observed data. For this analysis, we used a 95% confidence interval, meaning that we are 95% confident that the true value of the parameter being examined falls within the specified confidence interval. Statistical significance is assessed by comparing the confidence intervals of different groups. If the confidence intervals from two groups, such as that for the state and a specific county, do not overlap we consider the estimates to be significantly different from one another.

HPV-associated cancers: HPV-associated cancers were coded using the International Classification of Diseases for Oncology, 3rd Edition [ICD-0-3]. Cervix (ICD-O-3 site codes C53.0–C53.9) and were limited to carcinomas (ICD-O-3 histology codes 8010–8671, 8940–8941), Vagina (ICD-O-3 site code C52.9), vulva (ICD-O-3 site codes C51.0–C51.9), penis (ICD-O-3 site codes C60.0–60.9), anus (ICD-O-3 site code C21.0–C21.9, C20.9), and oropharyngeal (ICD-O-3 site codes C01.9, C02.4, C02.8, C05.1-C05.2, C09.0-C09.1, C09.8-C09.9, C10.0-C10.9, C14.0, C14.2 and C14.8). Cancer sites were limited to squamous cell carcinomas (ICD-O-3 histology codes 8050–8084, 8120–8131).
