Lung Cancer Prevention and Control in Vermont

Allison Verbyla, MPH, CPH
Division of Health Surveillance, Vermont Department of Health
Outline

- Cancer Preventive Behaviors
- Lung Cancer Incidence and Mortality in Vermont and U.S.
- Eligible Population for Lung Cancer Screening in Vermont
- Lung Cancer Screening in Vermont
- Vermont State Cancer Plan
- Next Steps
Cancer Preventive Behaviors
What Causes Cancer?

- Other causes of cancer include viruses, family history of cancer, reproductive factors, prescription drugs or medical procedures, and environmental pollution.

**3 Behaviors are Leading Causes of Cancer**

- Tobacco Use: 30%
- Poor Diet/Obesity/Lack of Exercise: 30%
- Other: 40%

PACK MENTALITY

WHY IS IT SO HARD TO QUIT SMOKING?

The average smoker inhales 1 to 2 milligrams of nicotine per cigarette. Most cigarettes on the U.S. market today have 2 to 10 milligrams or more of nicotine.

It takes 8 seconds for nicotine to reach the brain after inhaling tobacco smoke.

Nicotiana Tabacum

Nicotine was first isolated by German
chemists Wilhelm Heinrich Pottasch and Karl
Ludwig Reinmann in 1828 as a poisonous
ingredient of tobacco.

Once widely used as a pesticide,
a 60-milligram dose of the substance
can kill a human being.

Nicotine is a naturally occurring alkaloid—
or nitrogen-containing chemical—that can be
found in large amounts in the leaves of
tobacco plants. The bitter-tasting compound
is also composed of carbon, hydrogen and
sometimes oxygen. Together, all of these
chemicals can have powerful pharmacologic
and psychological effects on the human body.

“Pharmacologic and behavioral characteristics
that determine tobacco addiction are similar
to those that determine addiction to drugs
such as heroin and cocaine.”

American Heart Association

Figure 6.5 Inhalation of tobacco smoke.

Blood

THE PLEASURE PRINCIPLE

Research has shown that nicotine is the main silent agent in cigarettes. More than just a physical craving, it's also a psychological dependency.

1/

Our brain is made up of billions of nerve cells. They release chemical messengers called neurotransmitters that activate the receptor's nerve cell in order to communicate with other cells.

2/

The nicotine molecule is shaped
like the neurotransmitter called
acetylcholine, which is involved in
everything from muscle movement
and heart rate to memory.

3/

Once the nicotine reaches the brain,
it's able to attach to the acetylcholine
receptors and mimic its actions.
The body then responds to the
nicotine as if they were natural
neurotransmitters.

4/

Simultaneously, nicotine also raises
dopamine and endorphin levels, which
control feelings of pleasure and
rewards. At night, when you're asleep,
these pathways shut down and cravings
often occur immediately upon waking up.

5/

As smokers increase the amount of cigarettes they smoke, more nicotine is absorbed by their lungs and into their bloodstream. They have to maintain
this level of nicotine in order to keep the nervous system stable and prevent withdrawal symptoms.

6/

The nervous system eventually adapts to these levels and the smoker develops a tolerance to the drag.

What Causes Cancer?

- Tobacco use causes other cancers besides lung cancer.

Image Source: [https://www.cdc.gov/vitalsigns/cancerandtobacco/infographic.html#graphic](https://www.cdc.gov/vitalsigns/cancerandtobacco/infographic.html#graphic)
Lung Cancer Incidence and Mortality

- What is the lung cancer incidence rate in Vermont and U.S.?
- What is the mortality rate for lung cancer in Vermont and U.S.?
Leading Causes of Death in Vermont per 100,000 Population (2016)

- Diseases of the Heart: 218.5
- Malignant Neoplasms: 216.8
- Accidents: 59.4
- Chronic Lower Respiratory Diseases: 57.0
- Alzheimer's Disease: 49.6

Data Source: Vital Statistics 2016

Data available online in Tobacco Associated Cancers - Data Brief
Eligible Population for Lung Cancer Screening

- What proportion of Vermonters are a current or former smoker? How do these rates differ across the state?
- Who is the eligible population for lung cancer screening?
- Which populations have higher heavy smoking rates?
- What other comorbidities do the eligible population for lung cancer screening face?
What proportion of Vermont adults (ages 55-80) are a current or former smoker?

53% Of Vermont adults ages 55-80 are a current or former smoker. A current smoker is defined as a smoker who smokes everyday or sometimes.

In total, about 97,700 Vermont Adults ages 55-80 are a current or former smoker.
What proportion of Vermont adults (ages 55-80) are a current smoker?¹

12%

Of Vermont adults ages 55-80 are a current smoker. A current smoker is defined as a smoker who smokes everyday or sometimes.

In total, about 21,100 Vermont Adults ages 55-80 smoke currently.

¹A current smoker is defined as someone who has smoked more than 100 cigarettes and who now smokes every or some days. To find out more about Vermont’s Quitline, 802Quits, please visit, http://802quits.org/-providers/.
## Current Smokers Ages 55-80 by County/HSA

¹A current smoker is defined as a smoker who smokes everyday or sometimes.

*Value suppressed because sample size too small or relative standard error (RSE) is > 30.
Vermonters Eligible for Lung Cancer Screening

What proportion of Vermont adult smokers (ages 55-80) are current or former heavy smokers?

A heavy smoker is defined as,
• a current smoker with a 30 pack-year smoking history or
• a former smoker with a 30 pack-year smoking history who has quit within the last 15 years.

American Lung Association Lung Cancer Screening Eligibility Quiz available online at, https://www.lung.org/our-initiatives/saved-by-the-scan/quiz/
Vermonters Eligible for Lung Cancer Screening

What proportion of Vermont adult smokers (ages 55-80) are current or former heavy smokers?

11% Of Vermont adults ages 55-80 are current or former heavy smokers and therefore eligible for lung cancer screening.

In total, about 19,100 Vermont Adults ages 55-80 are eligible to receive lung cancer screening.

Note: Heavy smoker data is only available for one year, therefore county/HSA rates are not possible.
Heavy Smoking by Education and Income

The more education an adult ages 55-80 has, the less likely they are to be a current or former heavy smoker. Vermont adults ages 55-80 who make less than $50,000 annually are more likely to be eligible for lung cancer screening in comparison to those who make $50,000 or more.

**Percent of Vermont Adults Ages 55-80 who are a Current or Former Heavy Smoker by Education Level, 2017**

- High School Graduate: 19%*
- Some College: 10%*
- College Graduate or Higher: 4%

**Percent of Vermont Adults Ages 55-80 who are a Current or Former Heavy Smoker by Income Level, 2017**

- <$25,000: 20%**
- $25,000 - <$50,000: 13%**
- $50,000 - <$75,000: 7%
- $75,000 - $100,000+: 5%

*Statistically higher than the rate of heavy smoking for college graduates.

**Statistically higher than the rate of heavy smoking for those who make $50,000 or more a year.
Disability Status and Heavy Smoking

Which populations have higher heavy smoking rates?
There are about 2,300 Vermont adults ages 55-80 who are a current or former heavy smoker and have a self-care disability and 8,900 Vermont adults ages 55-80 who are a current or former heavy smoker and have any disability. About 1,200 (14%) of Vermont adults ages 55-80 with any disability were screened for lung cancer.

Percent of Vermont Adults who are a Current or Former Heavy Smoker Ages 55-80 by Disability Status, 2017

*Statistically higher than the no disability rate.*
Heavy Smoking by Age Group

Which populations have higher heavy smoking rates? There are about 4,600 Vermont adults ages 55-59 who are a current or former heavy smoker. For adults ages 60-69 and 70-80, there are 9,300 and 5,200 current or former heavy smokers, respectively. There are no statistical differences in heavy smoking by age group.

Percent of Vermont Adults who are a Current or Former Heavy Smoker by Age Group, 2017
What other comorbidities do the eligible population for lung cancer screening face? Vermont adults ages 55-80 who experience poor mental health most days are more likely to be a current or former heavy smoker in comparison to those who do not experience poor mental health.

*Mentally Health Status of Vermont Adults who are a Current or Former Heavy Smoker Ages 55-80, 2017

- 10% Mental health not good 0 days
- 12% Mental health not good 1-13 days
- 22%* Mental health not good 14-30 days

*Statistically higher than heavy smokers responding mental health not good 0 days.

Data Source: BRFSS 2017
Lung Cancer Screening in Vermont

- What proportion of eligible Vermonters have been screened for lung cancer?
- What is the availability of lung cancer screening in Vermont?
15% Of Vermont adults ages 55-80 who are a current or former heavy smoker are up-to-date on lung cancer screening.

*Value suppressed due to sample size too small or relative standard error (RSE) is > 30.

**Lung cancer screening is recommended for adults who are 55-80, have a 30 pack-year smoking history, and are a current smoker or stopped smoking within the last 15 years. Additional information about lung cancer screening recommendations can be found here: [https://www.uspreventiveservicestaskforce.org/Page/Document/UpdateSummaryFinal/lung-cancer-screening](https://www.uspreventiveservicestaskforce.org/Page/Document/UpdateSummaryFinal/lung-cancer-screening)

Note: Heavy smoker data is only available for one year, therefore county/HSA rates are not possible.
The Lung Cancer Screening Survey was fielded in 2017.

Purpose & Background
- To describe the needs of facilities in providing lung cancer screening.
- To identify gaps in access and availability of screening across the state.
- To evaluate concurrent tobacco cessation efforts.

Methods
- Survey was emailed to Director of Radiology/Imaging Services or, in some cases, a different provider (N=16).
- Survey contained 27 questions.
- Data were collected, de-identified and entered into Excel before being analyzed by SAS 9.3.

Out of the 16 surveys distributed, one facility declined to participate. Twelve facilities (75%) responded, and of those 12 facilities, eight currently offer lung cancer screening (LCS) and could answer survey questions regarding LCS.

Lung Cancer Screening Drive-Time Analysis and Focus Groups VT & NH
Drive-Time Analysis for Lung Cancer Screening in Vermont & New Hampshire Hospitals

Methods:

- Map was developed by the Dartmouth Norris Cotton Cancer Center’s Geospatial Analyst.
- Lung Cancer Screening Centers (LCSCs) for New Hampshire and Vermont were identified through an accredited facility search on the American College of Radiology’s website https://www.acr accreditation.org/accredited-facility-search?modality=CTAP&designation=LCSC. In addition, a visual review of their map was done.
- All LCSCs that were identified were then geocoded using ArcGIS. The dark blue dots on the map are all accredited LCSCs as of October 8, 2018.
- The centroid of each census block was used and the travel time to the closest of the identified LCSC facilities was determined using ArcGIS. The centroids are colored based on their travel time and the population of the blocks for ages 55-84.

Focus Groups

Led By:
• Tracy Onega, PhD, MA, MS at the Dartmouth Norris Cotton Cancer Center

Goals:
• Describe knowledge, attitudes, and beliefs of rural NH & VT residents related to lung cancer screening and quitting smoking
• Identify barriers and facilitators in rural communities in NH & VT related to lung cancer screening and quitting smoking
• Assess acceptability of community-level interventions to increase access to lung cancer screening and services to quit smoking
Focus Groups

Target Audience:
• People eligible for lung cancer screening living in rural counties in NH & VT

• Focus Groups Held in:
  • Berlin (NH)
  • Colebrook (NH)
  • Newport (NH)
  • St. Johnsbury (VT)
  • South Royalton (VT)
Focus Groups

Preliminary Findings:
Most people:
• Have **never heard of** lung cancer screening
• Would be **interested in getting screened**
• Feel their **doctor should have talked with them** about screening
• Think that **education/awareness** is the biggest barrier to getting people screened
  • Brochures in waiting rooms
  • Sending patients reminders like with mammogram
  • Fairs, community events
  • Messaging in convenience stores
  • Facebook, newspaper, TV, radio ads

Next Steps:
• **Interview clinicians** who have and who have not referred
• **Develop intervention** plans for target communities
Have the 2016-2020 Vermont State Cancer Plan Objectives related to lung cancer improved since 2016?
Vermont State Cancer Plan Objectives

- **Objective 2.1** - Decrease % of adults who smoke cigarettes.
  - From 80% to 74%, no statistical difference.

- **Objective 2.1 a** - Decrease % of adults below 250% of FPL who smoke cigarettes.
  - From 29% to 28%, no statistical difference.

- **Objective 2.1 b** - Decrease % of adult cancer survivors who smoke cigarettes.
  - From 26% to 25%, no statistical difference.

- **Objective 2.2** - Decrease % of adolescents in grades 9-12 who smoke cigarettes.
  - \(\downarrow\) From 11% to 9%, statistically better.

Image sources: [www.med.uvm.edu](http://www.med.uvm.edu), [www.seormc.org](http://www.seormc.org)
Vermont State Cancer Plan Objectives

- **Objective 2.3** - Increase % of adult smokers attempting to quit in the past year.
  - From 59% to 49%, statistically worse.

- **Objective 2.4** - Decrease % of adult non-smokers exposed to secondhand smoke. §
  - From 48% to 44%, cannot be compared.

- **Objective 2.5** - Decrease incidence rate of tobacco-associated cancers (per 100,000 persons) †.
  - From 197.5 to 167.6, cannot be compared.

---

§ Baseline and current values are age-adjusted to the 2000 U.S. population to be consistent with other Healthy Vermonters 2020 objectives. They cannot be compared to earlier published values. This baseline value and current value cannot be compared to the target value because the target value is not age-adjusted.

† Baseline values and 2020 targets were recalculated using the CDC methodology released in October 2017 and cannot be compared to earlier published values. For more information on CDC methodology, please visit [https://www.cdc.gov/cancer/npcr/pdf/public-use/predefined-seer-stat-variables.pdf](https://www.cdc.gov/cancer/npcr/pdf/public-use/predefined-seer-stat-variables.pdf)

Current values were calculated using the CDC methodology released in April 2018 (limited to microscopically confirmed diagnoses only) and cannot be compared to baseline or 2020 target values.

Image source: [www.naaccr.org](http://www.naaccr.org)
Objective 10.1 - Decrease rate of lung cancer diagnosed at an advanced stage among adults 55+ (per 100,000 persons).
  • From 210.0 to 193.6, no statistical difference.

Objective 10.2 - Decrease % of lung cancers diagnosed at an advanced stage among adults 55+.
  • From 80% to 74%, no statistical difference.
Next Steps
Next Steps

- Promote the statewide cancer coalition, Vermonters Taking Action Against Cancer (VTAAC), to gain better representation from lung cancer specialists throughout the state.

- Continue collaboration among partners through VTAAC Lung Cancer Screening Taskforce. Review new Vermont screening & eligibility data, drive-time analysis, and focus group data to develop an Action Plan to improve LCS in Vermont.

- Continue collection of LCS data to assess and track trends through 2019 BRFSS Lung Cancer Screening Module and potential UVM research.
Next Steps (cont.)

- Continue education of primary care providers around importance of LCS, referral processes to screening centers, and ways to improve cancer screening rates.

- Provide resources for select Vermont clinic staff in the implementation of health systems interventions at the clinic level such as individual provider reports/dashboards.

- Support hospitals looking to improve their capacity to screen eligible Vermonters and attain accreditation for LCS.
Data Notes

**Behavioral Risk Factor Surveillance System (BRFSS):** Vermont tracks risk behaviors using this telephone survey of adults. The results are used to plan, support, and evaluate health promotion and disease prevention programs. Since 1990, Vermont, along with the 49 other states and three territories, has participated in the BRFSS with the Centers for Disease Control and Prevention (CDC). Over 7,000 Vermonters are randomly and anonymously selected and called annually. An adult (18 or older) in the household is asked a uniform set of questions. The results are weighted to represent the adult population of the state.

**Youth Risk Behavior Survey (YRBS):** Every two years since 1993, the Department of Health's Division of Alcohol and Drug Abuse Program, and the Department of Education's Coordinated School Health Programs have sponsored the YRBS. The YRBS measures the prevalence of behaviors that contribute to the leading causes of death, disease, and injury among youth. The YRBS is part of a larger effort to help communities increase the "resiliency" of young people by reducing high risk behaviors and promoting healthy behaviors.

**Vermont Cancer Registry (VCR):** The Vermont Cancer Registry (VCR) is Vermont’s statewide population-based cancer surveillance system. The registry collects information about all cancers (except non-melanoma skin cancers and carcinoma in situ of the cervix) and all benign brain tumors diagnosed in Vermont. All statistics exclude in situ carcinomas except urinary bladder, unless indicated otherwise. Vermont cases include Vermont residents only.

**Adult Tobacco Survey (ATS):** The Vermont Adult Tobacco Survey is a telephone survey of Vermont adults (18+). The data are used to help evaluate the effectiveness of Vermont Tobacco Control Program efforts to reduce smoking and increase awareness and knowledge on smoking data. Vermont has conducted the Adult Tobacco Survey annually from 2001 to 2008, and every other year thereafter (i.e., 2010, 2012, 2014). The sample includes 2,000 respondents each year, 1,000 each of smokers and non-smokers. Results are weighted by age, gender, county, household composition, telephone type, and smoking status in order to compensate for differences between the sample and the overall Vermont adult population. The weighting procedure ensures that the sample is representative of the Vermont adult population.

**NPCR and SEER Incidence 1999-2015 Database (NPCR & SEER):** The U.S. incidence rates are based on the National Program of Cancer Registries (NPCR) and the Surveillance, Epidemiology, and End Results (SEER) Program Incidence State Restricted Access Data File (1999-2015). A reporting delay by Department of Veterans Affairs (VA) has resulted in incomplete reporting of VA hospital cases in 2011 through 2015.

**Age Adjustment:** Measures from BRFSS and YRBS are adjusted for age only if they are Healthy Vermonters 2020 goals. Age adjustment groupings come from those determined by Healthy People 2020.
**Data Notes**

**Confidence Intervals used for statistical comparisons:** A confidence interval represents the range in which a parameter estimate could fall which is calculated based on the observed data. For this analysis, we used a 95% confidence interval, meaning that we are 95% confident that the true value of the parameter being examined falls within the specified confidence interval. Statistical significance is assessed by comparing the confidence intervals of different groups. If the confidence intervals from two groups, such as that for the state and a specific county, do not overlap we consider the estimates to be significantly different from one another.
